USA Gasoline Prices from 1984 to 2004

Statistics

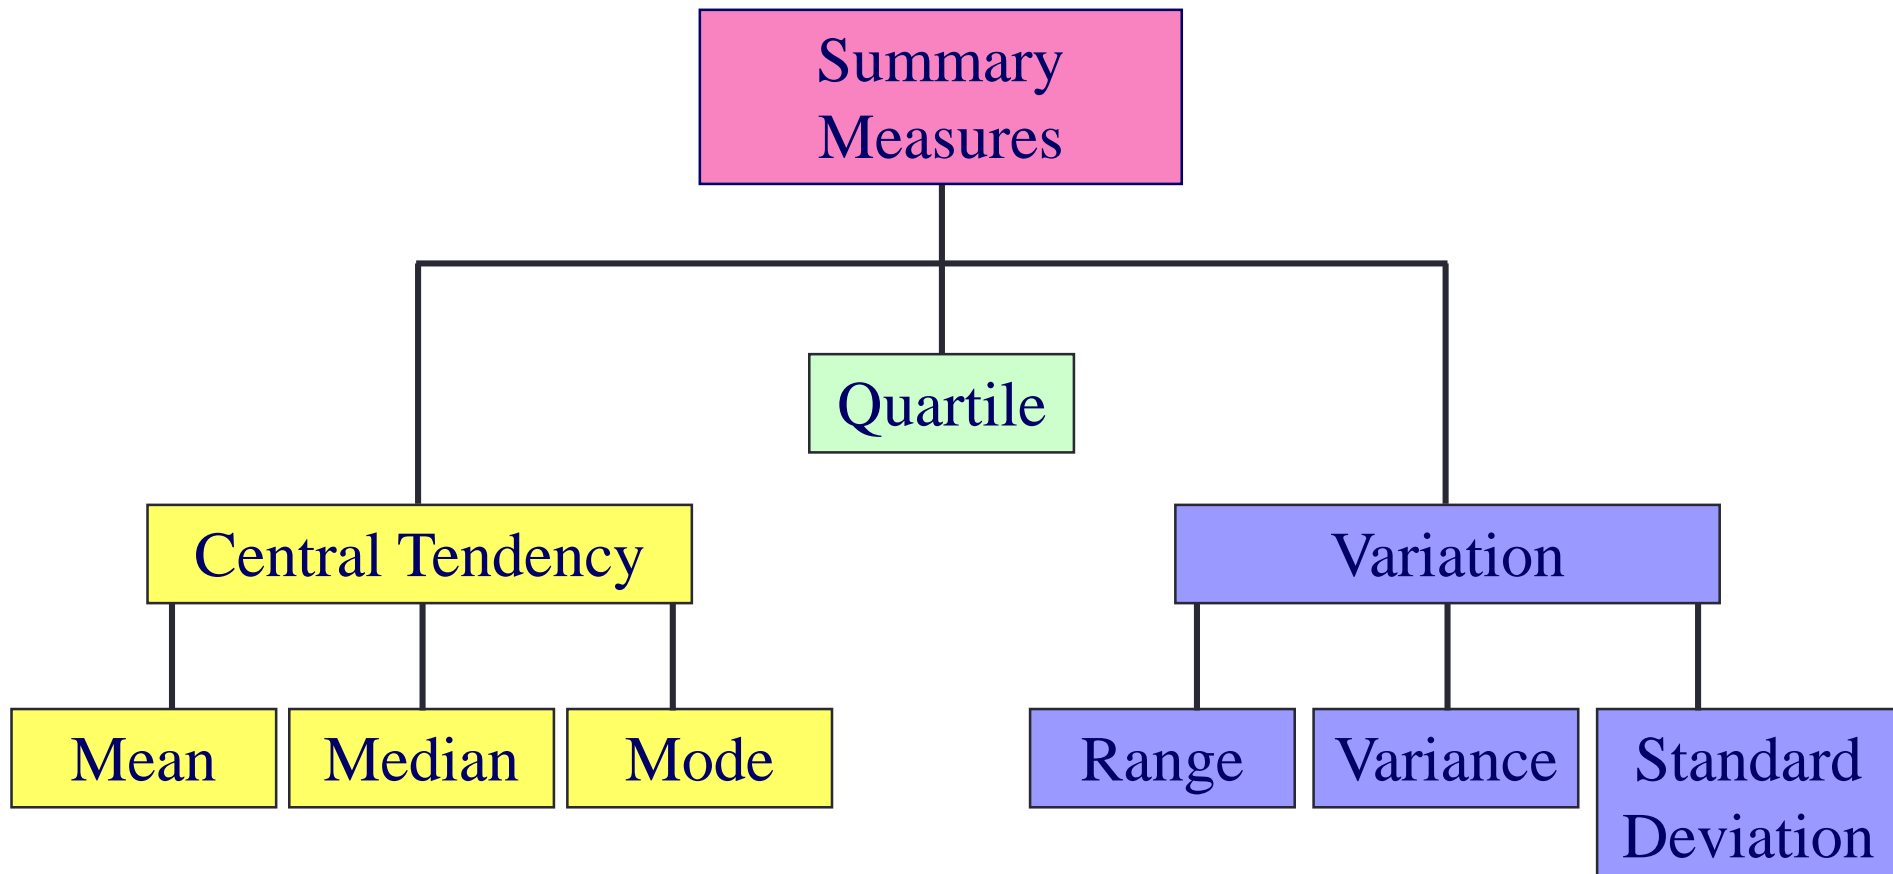

- The science of “data”
- Involving the collection, analysis, interpretation, presentation, and organization of data

Main Statistical Methodologies

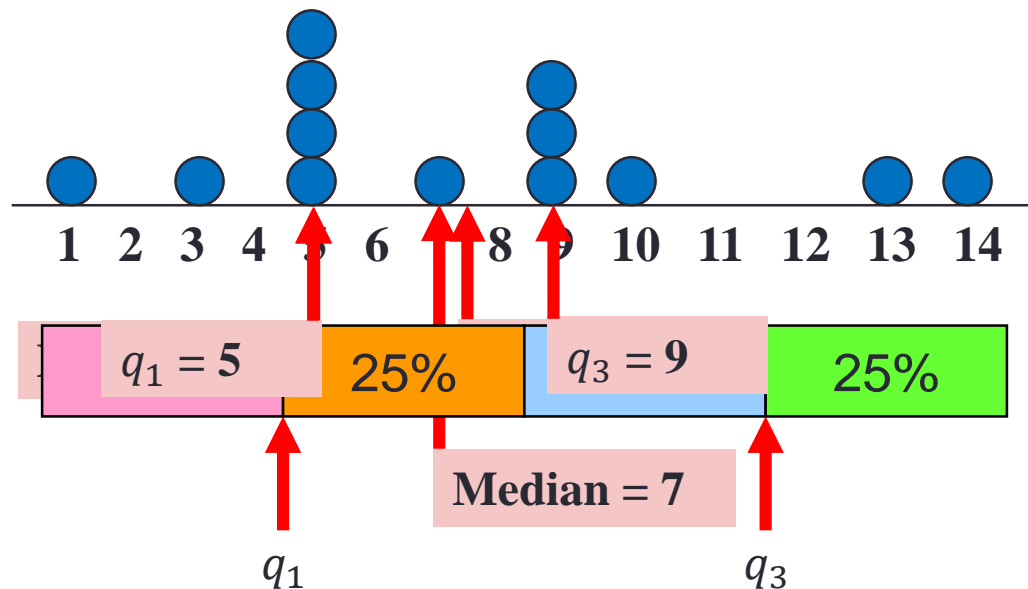

Numerical and graphical methods to look for patterns, to summarize the information in a data set

Summary Measures

Mean, Median, Mode, and Quartile

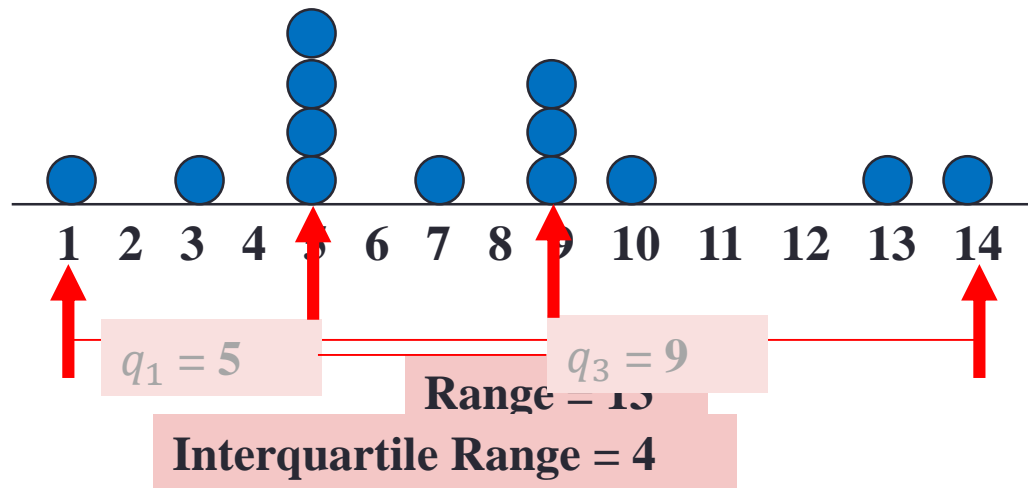

- Suppose we have samples:

mean	Average or mean value of array
median	Median value of array
mode	Most frequent values in array
prctile	Percentiles of a data set

Range and Interquartile Range

- Suppose we have samples:

max

Largest elements in array

min

Smallest elements in array

Variance and Standard Deviation

- Suppose we have samples:

- Variance: $s = \frac{\sum(x_i - \bar{x})^2}{n-1} = 14.3974$
- Standard deviation: $s = \sqrt{\frac{\sum(x_i - \bar{x})^2}{n-1}} = 3.7944$

[std](#)

Standard deviation

[var](#)

Variance

Exercise

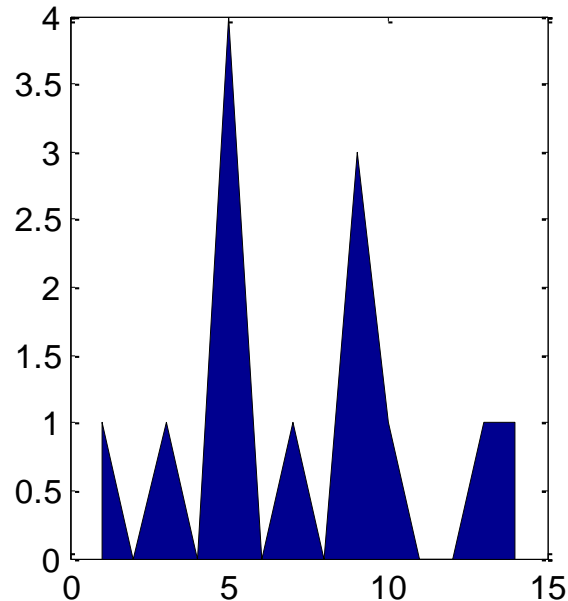

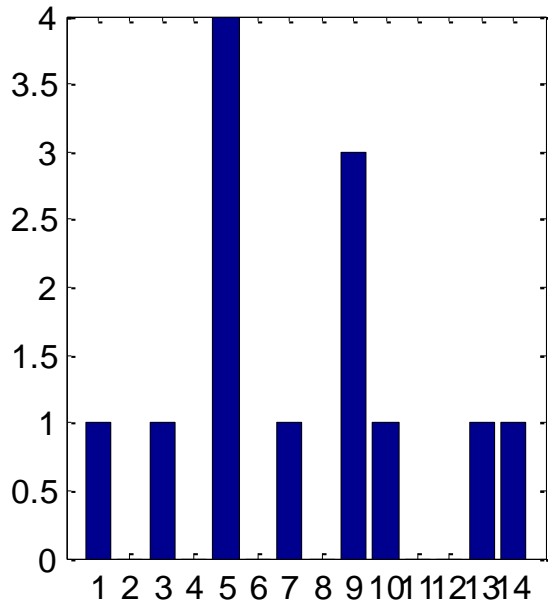

- Find the following properties of the variable `x4`
 1. Mean, median, mode, and quartile
 2. Range and interquartile range
 3. Variance and standard deviation

```
load stockreturns;  
x4 = stocks(:,4);
```

Figures Are Always More Powerful

- Suppose we have samples:

```
x = 1:14;  
freqy = [1 0 1 0 4 0 1 0 3 1 0 0 1 1];  
subplot(1,3,1); bar(x,freqy); xlim([0 15]);  
subplot(1,3,2); area(x,freqy); xlim([0 15]);  
subplot(1,3,3); stem(x,freqy); xlim([0 15]);
```

Exercise

- Suppose we are given the samples:

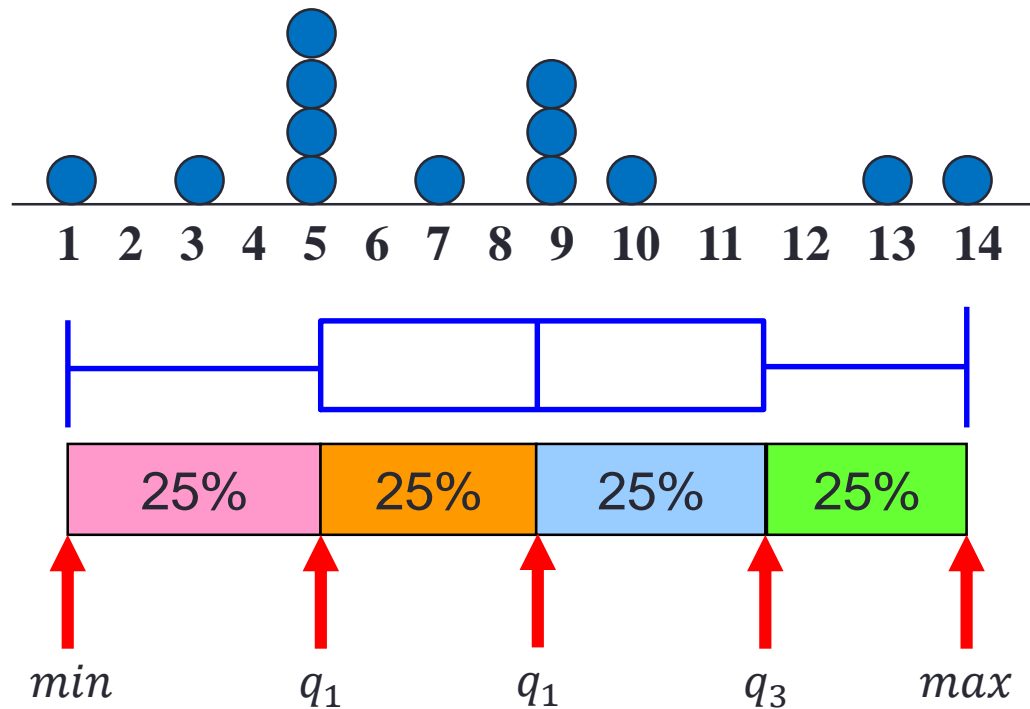

```
x = [1 3 5 5 5 5 7 9 9 9 10 13 14];
```

- Plot the histograms:

Boxplot

- Suppose we are given the samples:

Boxplot Example

```
marks = [80 81 81 84 88 92 92 94 96 97];  
boxplot(marks)  
prctile(marks, [25 50 75])
```

Exercise

- Plot the boxplot of the variable `stocks`

```
load stockreturns;
```

Skewness

- A measure of distribution skewness
 - Left-skewed: skewness < 0
 - Right-skewed: skewness > 0

Left-Skewed

Mean $<$ Median $<$ Mode

Symmetric

Mean = Median = Mode

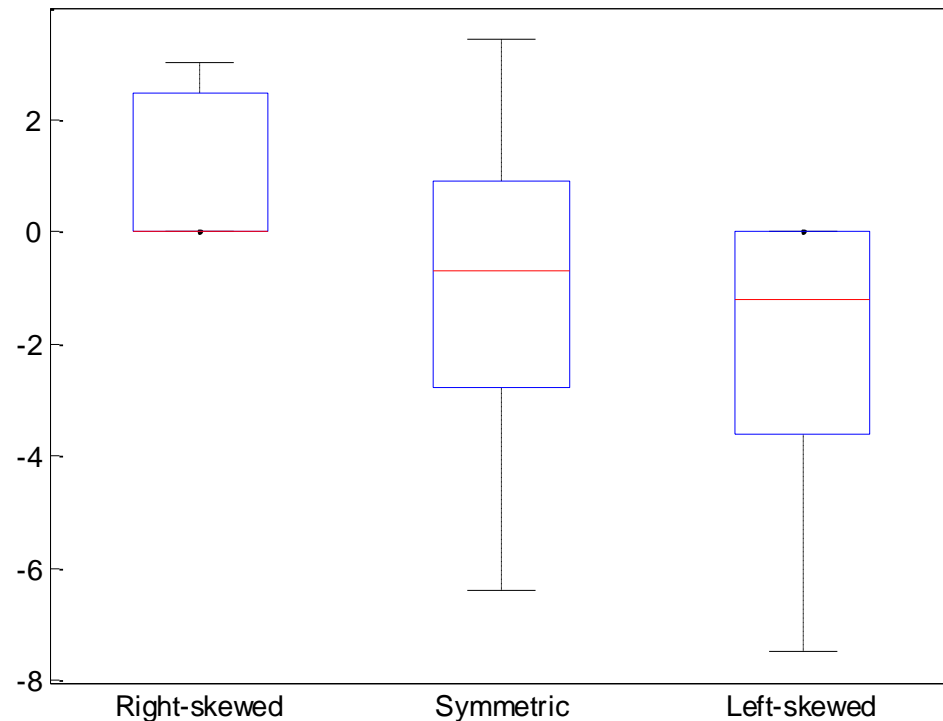

Right-Skewed

Mode $<$ Median $<$ Mean

Skewness: skewness ()

```
X = randn([10 3])*3;  
X(X(:,1)<0, 1) = 0; X(X(:,3)>0, 3) = 0;  
boxplot(X, {'Right-skewed', 'Symmetric', 'Left-skewed'});  
y = skewness(X)
```

Kurtosis

- A measure of distribution flatness
- A kurtosis of a normal distribution is zero
 - Positive Kurtosis: more acute peak
 - Negative Kurtosis: more flat peak

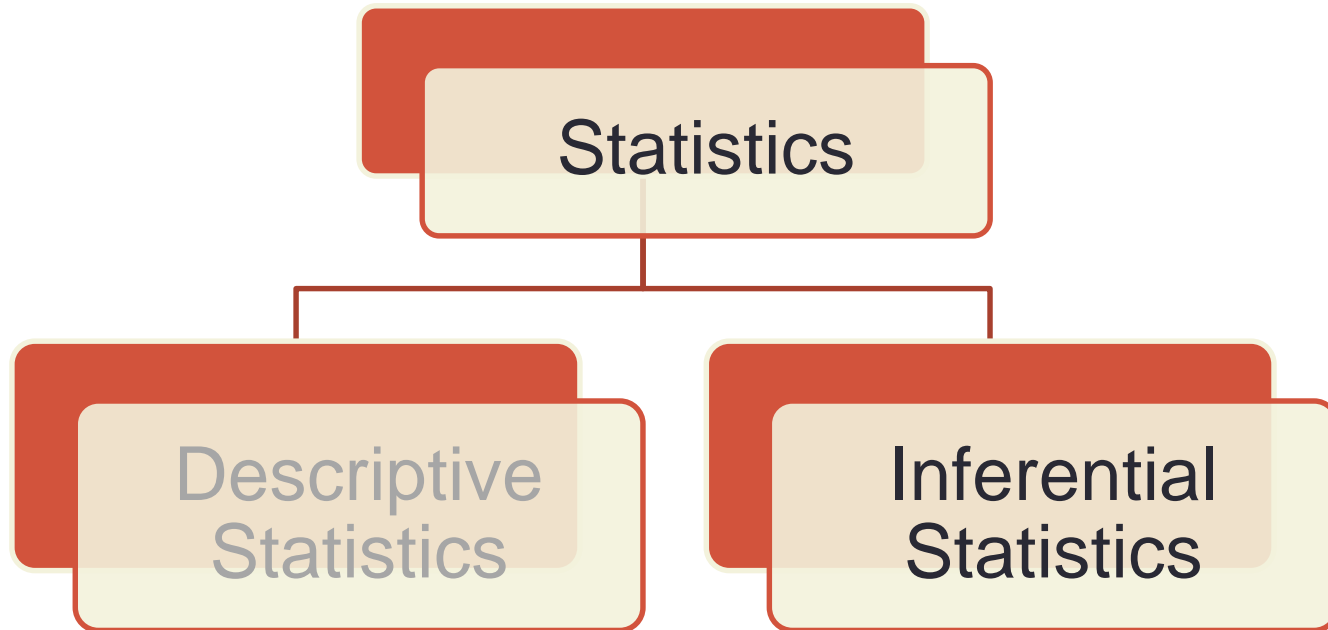

Exercise

- Find the skewness and kurtosis for each column of the variable `stocks`

```
load stockreturns;
```

Main Statistical Methodologies

Methods to make estimates, decisions, and predictions using sample data

Statistical Hypothesis Testing

- A method of making decisions using data
- Example: Am I going to get grade A in this class?
- Typical hypothesis:
 - $H_0: \theta = \theta_0$ v.s. $H_1: \theta \neq \theta_0$
 - $H_0: \theta \geq \theta_0$ v.s. $H_1: \theta < \theta_0$
 - $H_0: \theta \leq \theta_0$ v.s. $H_1: \theta > \theta_0$

where H_0 is null hypothesis, and H_1 is alternative hypothesis

Hypothesis Testing Procedure

- Determine a probability, say 0.95, for the hypothesis test
- Find the 95% “confidence Interval” of the H_0
- Check if your score falls into the interval

Terminology in Hypothesis Testing

- Determine a probability, say 0.95, for the hypothesis test
- Find the 95% “confidence Interval” of the H_0
- Check if your score falls into the interval
- Terminology:
 - Confidence interval
 - Confidence level $(1 - \alpha)$
 - Significance level α
 - p-value

t-test Example

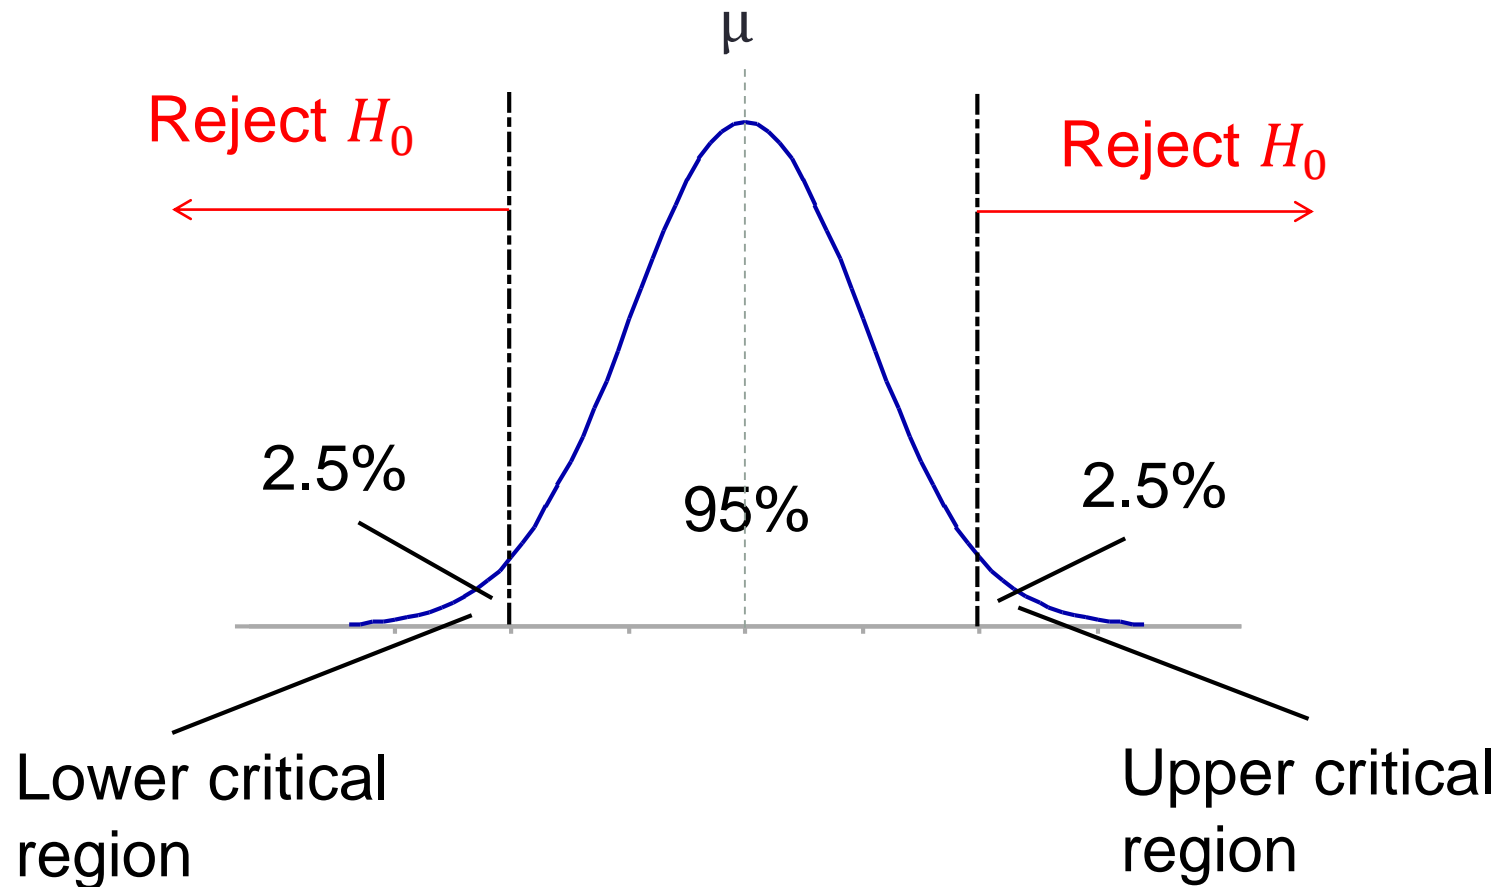

- Are means of the two stock returns (#3 and #10) the same?

```
load stockreturns;  
x1 = stocks(:,3); x2 = stocks(:,10);  
boxplot([x1, x2], {'3', '10'});  
[h,p] = ttest2(x1, x2)
```

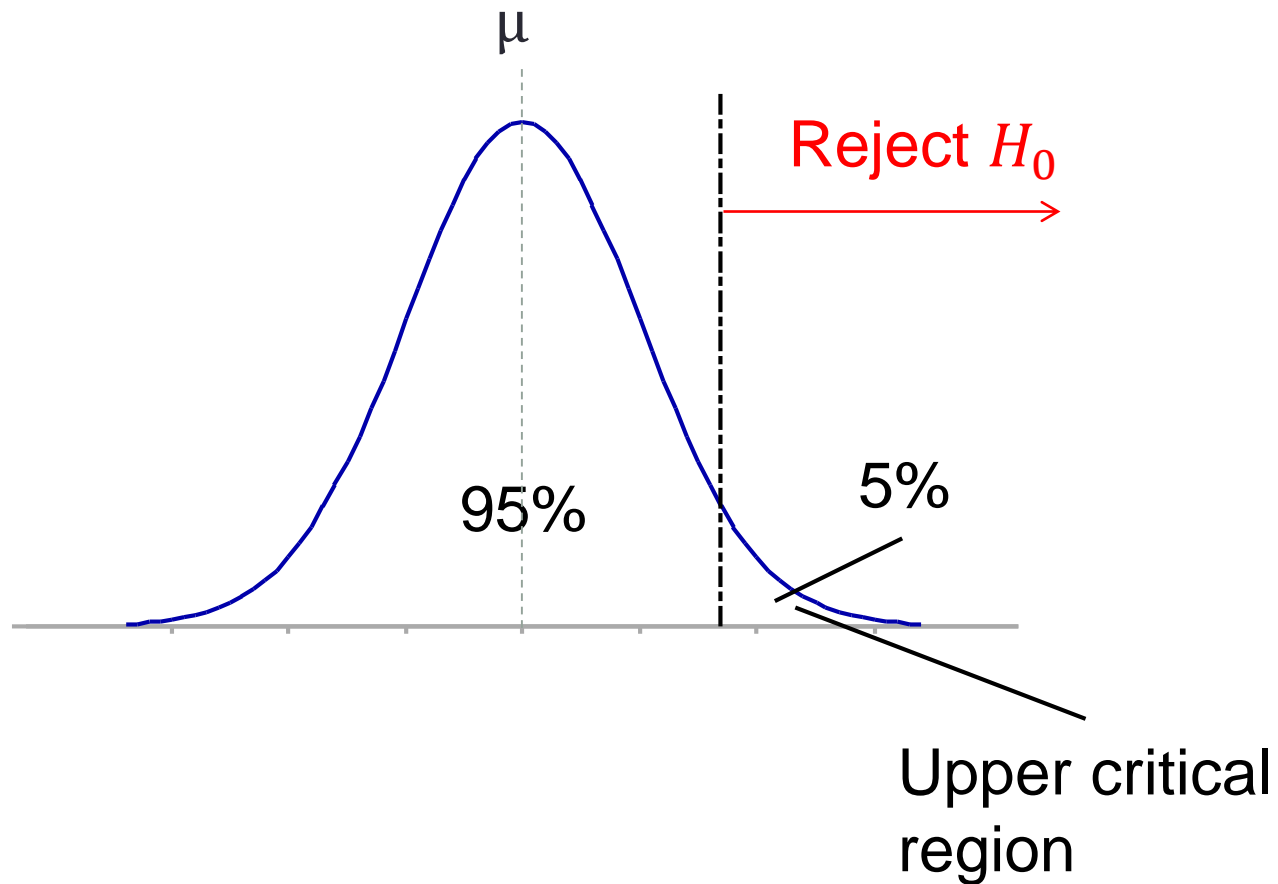

Two-tailed Significance Test

- Using a 5% significance level

One-tailed Significance Test

- Using a 5% significance level

Common Hypothesis Tests

	Paired data	Unpaired data	More than two groups
Parametric	<ul style="list-style-type: none"> • z-test • t-test 	<ul style="list-style-type: none"> • two-sample t-test 	<ul style="list-style-type: none"> • Analysis of variance (ANOVA)
Non-parametric	<ul style="list-style-type: none"> • Sign test • Wilcoxon signed-rank test 	<ul style="list-style-type: none"> • Wilcoxon rank-sum test 	

[ranksum\(\)](#)

Wilcoxon rank sum test

[signrank\(\)](#)

Wilcoxon signed rank test

[ttest\(\)](#)

One-sample and paired-sample t-test

[ttest2\(\)](#)

Two-sample t-test

[ztest\(\)](#)
