

TASK-17: Start Here Onboarding Hub

Content draft. Redbelly DAO Community Task Board. Brand kit: Kinetic Consensus, redbelly-dao-taskboard.vercel.app/brand. Prepared for Lovable build hand-off.

KYC

KYC is required for native RBNT and mainnet activity: transactions, staking, and governance. It is not required to hold or trade wrapped RBNT on other chains.

Redbelly gates its own Layer 1 behind identity verification through the Redbelly Access portal. Wrapped RBNT on Ethereum or other chains is a standard ERC-20 with no Redbelly-side identity check.

One verified identity can activate up to 10 wallets. Most submissions are approved in about 3 to 5 minutes; submissions needing manual review can take longer.

MOD-VERIFIED, DISCORD, NO PUBLISHED DOC: the 10-wallet limit and typical approval time.

Regional restrictions

Eighteen jurisdictions are currently restricted from accessing the Redbelly Network platform: Afghanistan, Central African Republic, North Korea, Democratic Republic of the Congo, Guinea-Bissau, Iran, Iraq, Lebanon, Libya, Myanmar, Russia, Somalia, South Sudan, Sudan, Syria, Ukraine, Yemen, and Zimbabwe. Anyone outside this list can proceed with KYC and mainnet access. Anyone inside it cannot, regardless of wallet or exchange used.

Network setup

Mainnet

Chain ID	151
Currency symbol	RBNT (18 decimals)
RPC URL	https://governors.mainnet.redbelly.network
Block explorer	https://redbelly.routescan.io

Testnet

Chain ID	153
Currency symbol	RBNT (18 decimals)
RPC URL	https://governors.testnet.redbelly.network
Block explorer	https://redbelly.testnet.routescan.io

Mainnet and testnet never share a field. Chain ID, RPC, and explorer are each unique to their own network.

Source: chainlist.org/chain/151, chainlist.org/chain/153, and the [ethereum-lists/chains](https://github.com/ethereum-lists/chains) repository, cross-checked against a live call to the testnet RPC endpoint. Two testnet explorer URLs are in circulation; this draft uses the more recently updated one (redbelly.testnet.routescan.io). Confirm before publish.

Zero-value wallet balance explainer

This is uncommon, and when it happens it is almost always about wRBNT (wrapped RBNT), not native RBNT. Native RBNT is the network's gas token and does not need a contract address added to display correctly. wRBNT does.

If your wRBNT balance shows as zero, check in this order:

- Contract address: confirm the wRBNT contract address is added correctly in your wallet. A missing or wrong contract address is the most common cause of a zero display.
- Try another wallet: if it still shows zero, check the same address in a different wallet extension, for example Rabby. If the balance appears there, the issue is with the first wallet's display, not your funds.
- Check the block explorer: if it is still not showing, look up your wallet address directly on Routescan. If the balance is there, your funds are safe and the discrepancy is on the wallet's display side only.
- Check the source transaction: if the balance genuinely is not showing anywhere, including the explorer, confirm the original transfer or bridge actually executed successfully.

A zero balance in your wallet does not mean lost funds. In almost all cases the tokens are on-chain and visible on the explorer. The wallet interface simply is not recognizing or displaying them yet.

MOD-VERIFIED, DISCORD, NO PUBLISHED DOC: this entire explainer.

Source: contributor's own troubleshooting experience with wRBNT display issues. Not published in official Redbelly documentation.

Where to buy and trade

Centralized exchanges

- MEXC
- Gate.io
- WhiteBit
- BYDFi

Decentralized exchanges

- Ethereum: 1inch, OKX DEX, and Bitget Web3, swapping against the RBNT contract on Ethereum.
- Base: KyberSwap, 1inch, OKX DEX, and Bitget Web3.
- Solana: Raydium.
- Redbelly native: RedDex, swapping directly on-chain against native RBNT.

Bridges

To move RBNT between chains: Lucid Labs Bridge, or the RedDex Bridge.

Native RBNT and wrapped RBNT are separate assets on different chains. Check which one a venue lists before trading.

Source: exchange and DEX listings and contract addresses cross-checked against the venues' own pages.

Staking basics

RBNT can be staked to consensus or storage nodes to help secure the network and earn rewards. Staking is a mainnet action and requires KYC, the same as any other native transaction.

Stake through RedDex: reddex.io/stake

Available pools differ by lock period and reward rate. Some carry no lock period; others lock funds for a fixed term for a higher rate. Rates and total value locked change over time, so check the staking page directly for current numbers rather than relying on a snapshot here.

Source: staking mechanism confirmed against the Redbelly whitepaper (consensus and storage node staking). Live pool terms from reddex.io/stake.

Scam warning

Redbelly staff, moderators, and official support will never DM you first. Any direct message claiming to be from Redbelly staff, offering support, or announcing a giveaway is a scam, no exceptions.

Common patterns to watch for:

- Unsolicited DMs offering help with a wallet or KYC issue.
- Claims of a giveaway, airdrop, or reward requiring a wallet connection or seed phrase.
- Anyone asking for your seed phrase, private key, or asking you to verify your wallet through a link.

Official Redbelly communication only happens through public channels: this site, official docs, and public Discord channels. If you are unsure whether a message is legitimate, do not click any link or connect your wallet. Verify in a public channel first.

Testnet faucet

Get free testnet RBNT to deploy and test on Redbelly Testnet, Chain ID 153.

- Faucet: vine.redbelly.network/rbnt-faucet, FAUCETME-powered.
- Claim amount: 500 RBNT per claim.
- Network: Testnet, Chain ID 153.
- Typical deployment cost: effectively zero gas on testnet.
