Getting Started with Metasploit

First things first. If you haven't installed Metasploit yet, check out these instructions. Otherwise, if you already have Metasploit installed, congratulations! You've come to the right place to get started.

About Metasploit

Metasploit is a penetration testing platform that enables you to find, exploit, and validate vulnerabilities. The platform includes the Metasploit Framework and its commercial counterparts: Metasploit Pro, Express, Community, and Nexpose Ultimate.

Metasploit Framework

The Metasploit Framework is the foundation on which the commercial products are built. It is an open source project that provides the infrastructure, content, and tools to perform penetration tests and extensive security auditing. Thanks to the open source community and Rapid7's own hard working content team, new modules are added on a regular basis, which means that the latest exploit is available to you as soon as it's published.

There are quite a few resources available online to help you learn how to use the Metasploit Framework; however, we highly recommend that you take a look at the Metasploit Framework Wiki, which is maintained by Rapid7's content team, to ensure that you have the most up to date information available.

If you are unable to find what you need, let us know, and we will add it to the documentation back log.

Metasploit Pro and Other Commercial Editions

The commercial editions of Metasploit, which include Pro, Express, Community, and Nexpose Ultimate, are available to users who prefer to use a web interface to pentest. In addition to a web interface, some of the commercial editions provide features that are unavailable in the Metasploit Framework.

Most of the additional features are targeted towards automating and streamlining common pentest tasks, such as vulnerability validation, social engineering, custom payload generation, and bruteforce attacks.

If you are command line user, but still want access to the commercial features, don't worry. Metasploit Pro includes its very only console, which is very much like msfconsole, except it gives you access to most of the features in Metasploit Pro via command line.

Metasploit Implementation

Rapid7 distributes the commercial and open source versions of Metasploit as an executable file for Linux and Windows operating systems.

You can download and run the executable to install Metasploit Pro on your local machine or on a remote host, like a web server. Regardless of where you install Metasploit Pro, you can access the user interface through a web browser. Metasploit Pro uses a secure connection to connect to the server that runs it.

If you install Metasploit Pro on a web server, users can use a web browser to access the user interface from any location. Users will need the address and port for the server that Metasploit Pro uses. By default, the Metasploit service uses port 3790. You can change the port that Metasploit uses during the installation process. So, for example, if Metasploit Pro runs on 192.168.184.142 and port 3790, users can use https://192.168.184.142:3790 to launch the user interface.

If Metasploit Pro runs on your local machine, you can use localhost and port 3790 to access Metasploit Pro. For example, type https://localhost:3790 in the browser URL box to load the user interface.

For more information on installation, check out Installing the Metasploit Framework or Installing Metasploit Pro and other commercial editions.

Metasploit Pro Components

Metasploit Pro consists of multiple components that work together to provide you with a complete penetration testing tool. The following components make up Metasploit Pro.

Metasploit Framework

The Metasploit Framework is an open source penetration testing and development platform that provides you with access to the latest exploit code for various applications, operating systems, and platforms. You can leverage the power of the Metasploit Framework to create additional custom security tools or write your own exploit code for new vulnerabilities. The Metasploit team regularly releases weekly updates that contain new modules and bi-weekly updates that contain fixes and enhancements for known issues with Metasploit Pro.

Modules

A module is a standalone piece of code, or software, that extends functionality of the Metasploit Framework. Modules automate the functionality that the Metasploit Framework provides and enables you to perform tasks with Metasploit Pro. A module can be an exploit, auxiliary, payload, no operation payload (NOP), or post-exploitation module. The module type determines its purpose. For example, any module that opens a shell on a target is an exploit module.

Services

Metasploit Pro runs the following services:

- PostgreSQL runs the database that Metasploit Pro uses to store data from a project.
- Ruby on Rails runs the web Metasploit Pro web interface.
- Pro service, or the Metasploit service bootstraps Rails, the Metasploit Framework, and the Metasploit RPC server.

Web Interface

A web interface is available for you to work with Metasploit Pro. To launch the web interface, open a web browser and go to https://localhost:3790.

Command Line Interface

The Pro Console enables you to interact with Metasploit Pro from the command line.

Understanding Basic Concepts and Terms

To familiarize you with Metasploit Pro, the following are some basic terms and concepts that you should understand:

- <u>Auxiliary module</u>: A module that does not execute a payload. Examples of auxiliary modules include scanners, fuzzers, and denial of service attacks.
- <u>Bind shell payload</u>: A shell that attaches a listener on the exploited system and waits for a connection to the listener.
- Database: The database stores host data, system logs, collected evidence, and report data.
- <u>Discovery scan</u>: A discovery scan is a Metasploit scan that combines Nmap and several Metasploit modules to enumerate and fingerprint targets.
- <u>Exploit</u>: A program that takes advantage of a specific vulnerability and provides an attacker with access to the target system. An exploit typically carries a payload and delivers it to a target. For example, one of the most common exploits is MS08-067, which targets a Windows Server Service vulnerability that could allow remote code execution.

- <u>Exploit module</u>: A module that executes a sequence of commands to exploit a vulnerability on a system or application to provide access to the target system. In short, an exploit creates a session. Exploit modules include buffer overflow, code injection, and web application exploits.
- <u>Listener</u>: A listener waits for an incoming connection from either the exploited target or the attacking machine and manages the connection when it receives it.
- <u>Meterpreter</u>: An advanced multi-function payload that provides you an interactive shell. From the Meterpreter shell, you can do things like download a file, obtain the password hashes for user accounts, and pivot into other networks. Meterpreter runs on memory, so it is undetectable by most intrusion detection systems.
- <u>Module</u>: A standalone prepackaged piece of code that extends the functionality of the Metasploit Framework. A module can be an exploit, auxiliary or post-exploitation module. The module type determines its purpose. For example, any module that can open a shell on a target is considered an exploit module. A popular exploit module is MS08-067.
- <u>Payload</u>: The actual code that executes on the target system after an exploit successfully compromises a target. The payload enables you to define how you want to connect to the shell and what you want to do to the target system after you take control of it.

A payload can be a reverse shell payload or a bind shell payload. The major difference between these payloads is the direction of the connection after the exploit occurs.

- <u>Post-exploitation module</u>: A module that enables you to gather more information or to gain further access to an exploited target system. Examples of post-exploitation modules include hash dumps and application and service enumerators.
- <u>Project</u>: A container for the targets, tasks, reports, and data that are part of a penetration test. A project contains the workspace that you use to create a penetration test and configure tasks. Every penetration test runs from within a project.
- Reverse Shell Payload: A shell that connects back to the attacking machine as a command prompt.
- Shell: A console-like interface that provides you with access to a remote target.
- Shellcode: The set of instructions that an exploit uses as the payload.
- Task: An action that Metasploit can perform, such as scanning, exploiting, and reporting.
- <u>Workspace</u>: The same thing as a project, except it's only used when referring to the Metasploit Framework.
- <u>Vulnerability</u>: A security flaw or weakness that enables an attacker to compromise a target. A compromised system can result in privilege escalation, denial-of-service, unauthorized data access, stolen passwords, and buffer overflows.

Metasploit Pro Workflow

The overall process of penetration testing can be broken down into a series of steps or phases. Depending on the methodology that you follow, there can be anywhere between four and seven phases in a penetration test. The names of the phases can vary, but they generally include reconnaissance, scanning, exploitation, post-exploitation, maintaining access, cleaning up, and reporting. The Metasploit Pro workflow can be tailored based on the various phases of penetration testing. Generally, the workflow includes the following steps:

- 1. Create a project: Create a project to store the data collected from your targets.
- 2. <u>Gather information</u>: Use the discovery scan, Nexpose scan, or import tool to supply Metasploit Pro with host data that can be used to identify vulnerabilities and access The scan discovers fingerprints and enumerates services on hosts.
- 3. <u>Exploit</u>: Use auto-exploitation or manual exploits to launch attacks against known vulnerabilities and to gain access to compromised targets.
- 4. <u>Perform post-exploitation</u>: Use post-exploitation modules or interactive sessions to gather more information from compromised targets. Metasploit Pro provides you with several tools that you can use to interact with open sessions on an exploited machine. For example, you can view shared file systems on the compromised target to identify information about internal applications and use the collection feature to gather system passwords and hashes.
- 5. Bruteforce: Run bruteforce attacks to test collected passwords against services to find valid logins.
- 6. <u>Clean up open sessions</u>: You can close open sessions on an exploited target to remove any evidence of any data that may be left behind on the system. This step restores the original settings on the target system.
- 7. <u>Generate reports</u>: Create a report that details your findings. Metasploit Pro provides several report types that you can use to customize the report data. The most commonly used report is the Audit Report, which provides a detailed look at the hosts and credentials captured in the project.

Accessing Metasploit Pro from the Web Interface

To access the web interface for Metasploit Pro, open a browser and go to https://localhost:3790 if Metasploit Pro runs on your local machine. If Metasploit Pro runs on a remote machine, you need to replace localhost with the address of the remote machine.

To log in to the web interface, you will need the username and password for the account you created when you activated the license key for Metasploit Pro. If you can't remember the password you set up for the account, you'll need to reset your password.

Supported Browsers

If the user interface is not displaying all of its elements properly, please make sure that you are using one of the supported browsers listed below:

- Google Chrome 10+
- Mozilla Firefox 18+
- Internet Explorer 10+
- Iceweasel 18+

Accessing Metasploit Pro from the Command Line

The Pro Console provides the functionality of Metasploit Pro through a command line interface and serves as an alternative to the Metasploit Web UI. If you have traditionally been a Metasploit Framework user, the Pro Console provides you with something similar to msfconsole.

You can use the Pro Console to perform the following tasks:

- Create and manage projects.
- Scan and enumerate hosts.
- Import and export data.
- Configure and run modules.
- Run automated exploits.
- View information about hosts.
- Collect evidence from exploited systems.

You cannot perform all Metasploit Pro tasks through the Pro Console. Tasks that are not supported include reporting, social engineering, running MetaModules, configuring task chains, running bruteforce attacks, and scanning web applications.

Launching the Pro Console on Windows

To launch the console on Windows, select Start > Metasploit > Metasploit Console.

You can also start the console from the command line. To launch the console from the command line, enter the following:

\$ cd /metasploit
\$ console.bat

Launching the Pro Console on Linux

To launch the console on Linux, open a terminal and run the following:

```
$ cd /opt/Metasploit/
$ sudo msfpro
```

Touring the Projects Page

Now that you are familiar with some of the basics of Metasploit, let's take a more in depth look at Metasploit Pro.

After you log in to Metasploit Pro, the first screen that appears is the Projects page. The Projects page lists all of the projects that are currently stored in the Metasploit Pro instance and provides you with access to the quick start wizards, global tools, and product news.

Regardless of where you are in the application, you can select **Project > Show All Projects** from the Global toolbar or click on the Metasploit Pro logo to access the Projects page, as shown below:

Creating a Project

Now that you're familiar with the Projects page, let's actually create a project.

A project contains the workspace, stores data, and enables you to separate an engagement into logical groupings. Oftentimes, you will have different requirements for the various subnets in an organization. Therefore, it may be efficient to have multiple projects to represent those requirements.

For example, you may want to create a project for the human resources department and another project for the IT department. Your requirements for these departments may vary greatly, so it would be logical for you to separate the targets into different projects. At the end of the engagement, you can generate separate reports for each department to perform a comparative analysis and present your findings to the organization.

Creating a project is easy. You can click on the **New Project** button on the Projects page or you can select **Project > New Project** from the global toolbar.

Metasploit*	Project V default	>			Account -	tdoan ▼ Administration ▼ ? 0
Home Projects	New Project Show All Projects

Want to learn more about projects? Check out this page.

Getting Target Data

The next thing you want to do is add data to your project. There are a couple of ways you can do this:

- Run a discovery scan
- Import data you already have

Scanning Targets

Scanning is the process of fingerprinting hosts and enumerating open ports to gain visibility into services running within a network. Scanning enables you to identify the active systems with services that you can communicate with so that you can build an effective attack plan. Metasploit has its own built-in discovery scanner that uses Nmap to perform basic TCP port scanning and gather additional information about the target hosts.

By default, the discovery scan includes a UDP scan, which sends UDP probes to the most commonly known UDP ports, such as NETBIOS, DHCP, DNS, and SNMP. The scan tests approximately 250 ports that are typically exposed for external services and are more commonly tested during a penetration test.

During a discovery scan, Metasploit Pro automatically stores the host data in the project. You can review the host data to obtain a better understanding of the topology of the network and to determine the best way to exploit each target. Oftentimes, the network topology provides insight into the types of applications and devices the target has in place. The more information that you can gather about a target, the more it will help you fine-tune a test for it.

Running a discovery scan is simple. From within a project, click the Scan button.

M metasploit*	Project - kittens fe	or your face 🔻		Account - tdoan 🔻 Administration 🔻 ?					1			
	Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Credentials	Reports	Exports	Tasks

Dashboard											٢	

When the New Discovery Scan form appears, enter the hosts you want to scan in the **Target addresses** field. You can enter a single IP address, an IP range described with hyphens, or a standard CIDR notation. Each item needs to appear on a newline.

Home kittens for your face New Discovery Scan											
* denotes required field											
Target addresses*	10.20.36.53 1020.37.*	(?)									
		1									

You can run the scan with just a target range; however, if you want to fine-tune the scan, you can configure the advanced options. For example, you can specify the hosts you want to exclude from the scan and set the scan speed from the advanced options.

Want to learn more about discovery scans? Check out this page.

Importing Data

If you are using a vulnerability scanner, you can import your vulnerability report into a Metasploit project for validation. The imported vulnerability data also includes the host metadata, which you can analyze to identify additional attack routes. Metasploit supports several third-party vulnerability scanners, including Nessus, Qualys, and Core Impact.

You can also export and import data from one Metasploit project into another. This enables you to share findings between projects and other team members.

To import data into a project, click the **Import** button located in the Quick Tasks bar. When the Import Data page appears, select either the **Import from Nexpose** or **Import from File** option. Depending on the option you choose, the form displays the options you need to configure to import a file.

	Project - kittens for your face 🔻 🛛 🗛							count - tdoan 🔻 Administration 🔻		
pro	Overview	Analysis Session	Campaigns	Web Apps	Modules	Credentials	Reports	Exports Tasks		
Home kittens for your face										
😨 Scan 🔄 Import 🖏 Nexpose 🔹 WebScan 👍 Bruteforce 🚱 Exploit 🕲 Campaign 🗙 Stop all tasks Search 🔍									Q	
Dashboard									۲	

For example, if you choose to import from Nexpose, you will need to choose the console you want to use to run a scan or import a site. If you choose to import a file, you will need to browse to the location of the file.

To see a full list of supported import types or to learn more about importing, check out this page.

Viewing and Managing Host Data

You can view host data at the project level or at the host level. At the project level, Metasploit provides a high-level view of all hosts that have been added to the project. To access the project view, select **Analysis > Hosts**. The project view initially shows the Hosts list, which displays the fingerprint and enumerated ports and services for each host. You can also view all the notes, services, vulnerabilities, and captured data for the project. To access these other views, click on their tabs from the project view.

Running a Vulnerability Scan

After you add target data to your project, you can run a vulnerability scan to pinpoint security flaws that can be exploited. Vulnerability scanners leverage vulnerability databases and checks to find known vulnerabilities and configuration errors that exist on the target machines. This information can help you identify potential attack vectors and build and attack plan that will enable you to compromise the targets during exploitation.

The integration with Nexpose enables you to launch a vulnerability scan directly from the Metasploit web interface. A Nexpose scan identifies the active services, open ports, and applications that run on each host and attempts to identify vulnerabilities that may exist based on the attributes of the known services and applications. Nexpose discloses the results in a scan report, which you can share with Metasploit for validation purposes.

To run a Nexpose scan, click the Nexpose button located in the Quick Tasks bar.

When the Nexpose configuration form appears, you need to configure and select the console you want to use to perform the scan. Similarly to a discovery scan, you need to define the hosts you want to scan. You'll also need to choose one of the available scan templates, which defines the audit level that Nexpose uses. For more information on scan templates, check out the Nexpose User Guide.

This information becomes handy in the next phase of the pentest: exploitation.

Vulnerability scanners are useful tools that can help you quickly find potential security flaws on a target. However, there are times when you may want to avoid detection and limit the amount of noise you create. In these cases, you may want to run some auxiliary modules, such as the FTP, SMB, and VNC login scanners, to manually identify potential vulnerabilities that can be exploited. Manual vulnerability analysis is considerably more time consuming and requires research, critical thinking, and in-depth knowledge on your part, but it can help you create an accurate and effective attack plan.

Finding and Exploiting Vulnerabilities the Easy Way

The easiest way to scan and check for vulnerabilities is through the Vulnerability Validation Wizard, which automates the validation process for Nexpose and Metasploit Pro users. The wizard provides a guided interface that walks you through each step of the validation process—from importing Nexpose data to auto-exploiting vulnerabilities to sending the validation results back to Nexpose.

If you don't have access to Nexpose and/or Metasploit Pro, the validation process requires manual analysis of the vulnerabilities. Manual validation requires a bit more legwork, but provides much more control over the vulnerabilities that are targeted.

For more information on vulnerability validation, check out this page.

Exploiting Known Vulnerabilities

After you have gathered information about your targets and identified potential vulnerabilities, you can move to the exploitation phase. Exploitation is simply the process of running exploits against the discovered vulnerabilities. Successful exploit attempts provide access to the target systems so you can do things like steal password hashes and download configuration files. They also enable you to identify and validate the risk that a vulnerability presents.

Metasploit offers a couple different methods you can use to perform exploitation: auto-exploitation and manual exploitation.

Auto-Exploitation

The auto-exploitation feature cross-references open services, vulnerability references, and fingerprints to find matching exploits. All matching exploits are added to an attack plan, which basically identifies all the exploits that are can be run. The simple goal of auto-exploitation is to get a session as quickly as possible by leveraging the data that Metasploit has for the target hosts.

To run auto-exploitation, click the Exploit button located in the Quick Tasks bar.

At a minimum, you'll need to provide the hosts you want to exploit and the minimum reliability for each exploit. The minimum reliability can be set to guarantee the safety of the exploits that are launched. The higher the reliability level, the less likely the exploits used will crash services or negatively impact a target. For a description of each module ranking, check out this page.

Home i est cske New Automated Exploitation Attempt		
Automated Exploit Settings		* denotes required field
Target Addresses*	10.20.36.53	3
		s
Minimum Reliability	Great	3
	Show Advanced Options	

Manual Exploitation

Manual exploitation provides a more targeted and methodical approach to exploiting vulnerabilities. It enables you to run select individual exploits one at a time. This method is particularly useful if there is a specific vulnerability that you want to exploit. For example, if you know that the SMB server on a Windows XP target does not have the MS08-067 patch, you may want to try to run the corresponding module to exploit it.

To search for modules, select **Modules > Search** and enter the name of the module you want to run. The best way to find an exact module match is to search by vulnerability reference. For example, if you want to search for ms08-067, you can either search for 'ms08-067'. You can also search by the module path: exploit/windows/smb/ms08_067_netapi.

One of the easiest ways to find an exploit for a vulnerability is directly from the vulnerability page. To view all vulnerabilities in the project, select **Analysis > Vulnerabilities**. You can click on the vulnerability name to view the related modules that can be used to exploit the vulnerability.

Configuring Common Exploit Module Settings

Each module has its own set of options that can be customized to your needs. There are too many possibilities to list here. However, here are some options that are commonly used to configure modules:

- <u>Payload Type</u>: Specifies the type of payload that the exploit will deliver to the target. Choose one of the following payload types:
 - **Command**: A command execution payload that enables you to execute commands on the remote machine.
 - Meterpreter: An advanced payload that provides a command line that enables you to deliver commands and inject extensions on the fly.
- <u>Connection Type</u>: Specifies how you want your Metasploit instance to connect to the target. Choose one of the following connection types:
 - Auto: Automatically uses a bind connection when NAT is detected; otherwise, a reverse connection is used.
 - Bind: Uses a bind connection, which is useful when the targets are behind a firewall or a NAT gateway.
 - Reverse: Uses a reverse connection, which is useful if your system is unable to initiate connections to the targets.
- LHOST: Defines the address for the local host.
- LPORT: Defines the ports that you want to use for reverse connections.
- <u>RHOST</u>: Defines the target address.
- <u>RPORT</u>: Defines the remote port you want to attack.
- Target Settings: Specifies the target operating system and version.
- Exploit Timeout: Defines the timeout in minutes.

Post-Exploitation and Collecting Evidence

Any exploit that successfully takes advantage of a vulnerability results in an open session you can use to extract information from a target. The real value of the attack depends on the data that you can collect from the target, such as password hashes, system files, and screenshots and how you can leverage that data to gain access to additional systems.

To view a list of open sessions, select the **Sessions** tab. Click on the session ID to view the postexploitation tasks that can be run against the host.

Generating a Report

At the end of the pentest, you'll want to create a deliverable that contains the results of your pentest. Metasploit provides a number of reports that you can use to compile test results and consolidate data into a distributable and tangible format. Each report organizes your findings into relevant sections, displays charts and graphs for statistical data, and summarizes major findings.

For more information on reports, check out this page.

Additional Resources

That was a lot of information that we just covered. If you want to learn more about specific things, visit the online help.

Now that you're familiar with some of the common tasks in Metasploit Pro, check out some of the other tasks you can perform:

- Want to automate your tasks? Check out task chains.
- Interested in bruteforce attacks? Go here to learn more.
- Want to launch a security awareness program? Learn how to build social engineering campaigns.
- Prefer the command line? Check out msfpro console.
- Interested in the framework? Go here to get started.

Setting Up a Vulnerable Target

A test environment provides a secure place to perform penetration testing and security research. For your test environment, you need a Metasploit instance that can access a vulnerable target. The following sections describe the requirements and instructions for setting up a vulnerable target.

Downloading and Setting Up Metasploitable 2

The easiest way to get a target machine is to use Metasploitable 2, which is an intentionally vulnerable Ubuntu Linux virtual machine that is designed for testing common vulnerabilities. This virtual machine is compatible with VMWare, VirtualBox, and other common virtualization platforms.

Metasploitable 2 is available at:

- https://information.rapid7.com/metasploitable-download.html
- https://sourceforge.net/projects/metasploitable/

The compressed file is about 800 MB and can take up to 30 minutes to download. After you have downloaded the Metasploitable 2 file, you will need to unzip the file to see its contents.

Powering on Metasploitable 2

Once the VM is available on your desktop, open the device, and run it with VMWare Player. Alternatively, you can also use VMWare Workstation or VMWare Server.

Logging in to Metasploitable 2

The login for Metasploitable 2 is msfadmin:msfadmin.

Identifying Metasploitable 2's IP Address

After you log in to Metasploitable 2, you can identify the IP address that has been assigned to the virtual machine. Just enter *ifconfig* at the prompt to see the details for the virtual machine.

msfadmin@metasploitable:~\$ ifconfig

The command will return the configuration for eth0. You'll need to take note of the inet address. This will be the address you'll use for testing purposes.
Help with Metasploitable 2

For more information on Metasploitable 2, check out this handy guide written by HD Moore.

Creating and Managing Projects

A project contains the workspace that you use to perform the different steps for a penetration test and stores the data that you collect from targets. You create a project to configure tasks and to run tests. You can create as many projects as you need and switch between projects while tasks are in progress.

You can create projects to separate an engagement into logical groupings. Oftentimes, you may have different requirements for the various departments, or subnets, within an organization. Therefore, it may be more efficient for you to have different projects to represent those requirements.

For example, you may want to create a project for the human resources department and another project for the IT department. Your requirements for these departments may vary greatly, so it would be logical for you to separate the targets into different projects. At the end of the engagement, you can generate separate reports for each department to perform a comparative analysis and present your findings to your organization or client.

Creating a Project

A project is the workspace that you use to build a penetration test. Each project logically groups together the hosts that you want to exploit and the type of information that you want to obtain. Every project has the following information:

- Name: Provides a unique identifier for the project.
- Description: Describes the purpose and scope of the project.
- <u>Network range</u>: Defines the default network range for the project. When you create a project, Metasploit Pro automatically populates the default target range with the network range that you define for the project. Metasploit Pro does not force the project to use the network range unless you enable the network range restriction option.
- <u>Network range restriction</u>: An option that restricts a project to a specific network range. Enable this option if you want to ensure that the test does not target devices outside the scope of the engagement. If you enable this option, Metasploit Pro will not run tasks against a target whose address does not fall within the network range.

To create a project:

1. From the Projects page, click the New Project button.

⇒ Go to Project									
Show	10 • entries				6)				
	Name 🍦	Hosts	Active Sessions	Tasks	Owner	Members	Updated 🔻	Description	
	USBKey	0	0	0	thao (thao)	1	about 2 hours ago		
—	PhishingScam	0	0	0	thao (thao)	1	about 2 hours ago		
	default	1	0	0	system	0	3 days ago		
Showing 1 to 3 of 3 entries First Previous 1 Next Last									

2. When the New Project page appears, find the **Project Settings** area, and enter the project name, description, and network range:

			* denotes required field
Project Settings			
	Project name*	My First Metasploit Project	
	Description	This is a sample project to try out some <u>pentest</u> features.	
	Network range	192.168.1.0-255	
		Restrict to network range	

- 3. Select the Restrict to network range option if you want to enforce network boundaries on the project.
- 4. From the User Access area, select the following information:
 - Project owner The person who owns the project.
 - Project members The users who can access, edit, and perform tasks in the project.
- 5. Create the project.

Deleting a Project

When you delete a project, you remove all the data that the project contains, including reports, host data, evidence, vulnerability data, and host tags. After you delete a project, you cannot view or access the project again.

If you want to delete the project, but save the project data, you can export the project data. When you export the project data, the system provides you with an XML or ZIP file of the project contents. You can import the XML or ZIP file to bring the project data back into Metasploit Pro.

- 1. Select **Project > Show All Projects** from the Main menu.
- 2. When the Projects page appears, select the projects that you want to delete.

Home Projects								
⇒⊙	Go to Project 📋 [Delete	🥜 Settings	🔘 Ne	w Project	Se	arch	Q

- 3. Click **Delete**.
- 4. When the confirmation window appears, click OK to delete the project.

Setting the Network Range

When you create a project, you can define an optional network range that sets the scope of the project. The network range defines the addresses that Metasploit Pro uses to automatically populate the target addresses for discovery scans and Nexpose scans. It also defines network boundaries that Metasploit Pro can enforce for the project.

You do not need to set the network range unless you want to enforce network boundaries. If you choose to enforce network boundaries on a project, Metasploit Pro uses the network range that you define for the project.

- 1. From within a project, select Project >Show All Projects from the Main menu.
- 2. Select the project that you want to set the network range for.

Home Projects								
→ Go to Project

4. In the **Network range** field, enter the network range that you want to restrict the project to. You can enter a single IP address, an IP range described with hypens, or a standard CIDR notation. If you define a CIDR notation, you can use an asterisk as a wild card. For example 192.168.1.* indicates 192.168.1.1-255.

		* denotes required field
Project Settings		
Project name*	My First Metasploit Project	
Description		
Network range	192 168 1 *	
	Restrict to network range	
	M Restrict to retwork runge	

5. Click the Update Project button.

Restricting a Project to a Network Range

You can restrict the network range to enforce network boundaries on a project. When you restrict a project to a network range, you cannot run any tasks unless the target addresses fall within network range that you define.

For example, if you have a client who wants you to test a specific network range, you can set the network range and restrict the project to it to ensure that you do not accidentally target any devices that are outside of that range.

- 1. Select **Project > Show All Projects** from the Main menu.
- 2. Select a project and click the Settings button.

Home Projects								
⇒ c	io to Project 前 [Delete	Settings	O Net	w Project	Se	arch	Q

5. Click the **Update Project** button.

Changing the Project Owner

By default, the project owner is the person who initially sets up the project. You can change the project owner to transfer ownership and to assign projects to team members.

The project owner provides a way for you and your team members to easily identify the projects that each of you own. For example, if you want to see the projects that you have been assigned, you can sort the project list by owner. All of your projects will be grouped together.

1. From the Main menu, select **Project > Show All Projects**.

User Access					
Project owner	thao (thao)				
Project members	thao (thao)				0
	john	tnao	tnao		
		john	-

6. Click the Update Project button.

Managing User Access

Every project has an owner. The owner can choose the users who can access the project to edit, view, and run tasks. However, users with administrative access can view and edit any project, regardless of whether or not the project owner gives them access.

As the project owner, you may want to restrict the team members who can view and edit your project. For example, if you have data that you do not want anyone to overwrite, you can disable the access rights for other team members.

I Team members that have administrative rights can view and modify all projects, regardless of the user access settings.

To manage the access that a user has to a project:

- 1. From the Main menu, select **Project > Show All Projects**.
- 2. When the Projects page appears, select the project that you want to edit.
- 3. Click the **Settings** button.

Home	Home Projects

6. Click the Update Project button.

Team Collaboration

The multi-user support provides you with the ability to collaborate on an engagement or penetration test with other team members. You and your team can log into the same instance of Metasploit Pro to perform tasks, review data, and share projects. You can access Metasploit Pro through the Metasploit Web UI, which can run on the local machine or across the network.

Some features that you can implement to enhance team collaboration are network boundaries, host tags, and host comments. These features help you create separate workloads for each team member and organize an engagement into logical containers. For example, you may want to assign certain hosts to a specific team member to test.

Adding Users to a Project

You can give team members access to a project so that they can view, edit, and run tasks from the project.

1. From the Main menu, select Project > Show All Projects.

M motosploit [®]		Project - USBKey 🔻	φ	1					A	ccount - thao 🔻	Administration V	?

6. Click the Update Project button.

Host Comments

You can add a host comment to share information about a host. For example, if you identify a vulnerability on a host, and you want to share that information with other project users, you can add a host comment to that host. When you view the host details, you can see comments that other users have added to the host.

Adding Host Comments

- 1. From within a project, select Analysis > Hosts.
- 2. Click on the name of the host to which you want to add a comment.
- 3. When the Host Details page appears, click the Update Comment button.

- 4. Enter the information you want to add to the host in the **Comments** field. For example, if you know that a host is not exploitable, you can add the information as a comment. When other team members see the note, they know that they should not attempt to exploit the host.
- 5. Click the Save Comments button.

Updating Host Comments

- 1. From within a project, select **Analysis > Hosts**.
- 2. Click on the name of the host to which you want to add a comment.

Managing Accounts

A user account provides you and your team members with access to Metasploit Pro. You use a user account to log into Metasploit Pro and to create identifies for other members on the team.

A user account consists of a login name, the user's full name, a password, and a role. Use the following components to set up a user account:

- Login name: The user name that the system uses to uniquely identify a person.
- Full name: The first and last name for the person who owns the user account.
- Password: An eight character string that allows access to the use account.
- <u>Role</u>: The level of access that the user has to Metasploit Pro and other projects. The role can be an administrator or basic user.

Account Types

A user account can be a non-administrator account or an administrator account. The account type determines the level of privileges that a user must have to perform certain tasks. For example, administrators have unrestricted access to the system so they can perform system updates, manage user accounts, and configure system settings. Non-administrator accounts, on the other hand, have access to Metasploit Pro, but can only perform a limited set of tasks.

Administrator Account

An administrator account has unrestricted access to all Metasploit Pro features. With an administrator account, you can do things like remove and add user accounts, update Metasploit Pro, and access all projects.

Non-Administrator Account

A non-administrator account gives a user access to Metasploit Pro, but does not provide them with unlimited control over projects and system settings. This account restricts the user to the projects that they have access to and the projects that they own.

A non-administrator account cannot perform the following tasks:

- Create or manage other user accounts.
- Configure global settings for Metasploit Pro.

- Update Metasploit Pro.
- Update the license key.
- View projects that they do have access to.

Creating a User Account

1. Click Administrator > User Administration from the main menu.

T motocoloit*	Project 🔻 🔎 1			Acco	unt - thao 🔻	Administration V
						Software Updates
						User Administration
Home Projects					<u> </u>	Software Licens
					_	Global Settings
⇒ Go to Project 📋 Delete	🖉 Settings 🛛 🔘 N	ew Project Searc	h 🔍	🛷 Product News		

- 2. When the User Administration page appears, click the New User button.
- 3. When the New User page appears, fill out the following information to create a user account:

	* denotes required field
User Settings Username*	
Full name	
Password*	0
Password confirmation*	

- User name: Enter a user ID for the account.
- Full name: Enter the user's first and last name.
- <u>Password</u>: Use mixed case, punctuation, numbers, and at least eight characters to create a strong password.
- Password confirmation: Re-enter the password.
- 4. Select the Administrator option if you want to provide the account with administrative rights. If the account has administrative privileges, the user has unrestricted access to all areas of Metasploit Pro. If the account does not have administrative rights, the user can only work with projects that they have access to and cannot update the system.
- If the account does not have administrative rights, click the Show Advanced Options button to choose the projects that the user can access.

Roles/Access				
		Administrator		
Pr	oject access	1	Project Name	Owner
		1	default	
			PhishingScam	thao (thao)
		1	USBKey	thao (thao)

6. Save the changes to the user account.

Account Requirements

All accounts must meet the user name and password requirements. If the user name or password does not meet one of the following criteria, Metasploit Pro displays an error until you input a user name and password that complies with every requirement.

User Name Requirements

A user name can contain any combination of the following characters:

- Alphanumeric characters
- Spaces
- Non-alphanumeric characters (!@#\$%^&*()+,.?/<>)

Password Requirements

A password must meet the following criteria:

- Contains letters, numbers, and at least one special character.
- Contain at least eight characters.
- Cannot contain the user name.
- Cannot be a common password.
- Cannot use a predictable sequence of characters

Changing an Account Password

1. Choose Administration > User Administration from the main menu.

	🖉 Cha	nge Password

- 6. Reenter the password in the **Password Confirmation** field.
- 7. Click the Change Password button.

Password Requirements

A password must meet the following criteria:

- Contains letters, numbers, and at least one special character.
- Contain at least eight characters.
- Cannot contain the user name.
- Cannot be a common password.
- Cannot use a predictable sequence of characters.

Resetting a Password

If you have forgotten your password or need reset your password, follow the instructions for your operating system.

Windows

- 1. From the Start menu, choose All Programs > Metasploit > Password Reset.
- 2. When the Password Reset window appears, wait for the environment to load.

- 3. When the dialog prompts you to continue, enter yes. The system resets the password to a random value.
- 4. Copy the password and use the password the next time you log in to Metasploit Pro.

You can change the password after you log in to Metasploit Pro.

5. Exit the Password Reset window.

Linux

1. Open the command line terminal and execute the following command: sudo </path/to/metasploit>/diagnostic_shell.

- 2. If prompted, enter your sudo password.
- 3. When the system returns the bash# prompt, enter </path/to/metasploit>/apps/pro/ui/script/resetpw to run the resetpw script.

😣 🛇 📀 thao@thao-laptop: ~	
File Edit View Terminal Help	
thao@thao-laptop:~\$ sudo /opt/metasploit-4.4.0/diagnostic_shell [sudo] password for thao: bash-4.1# /opt/metasploit-4.4.0/apps/pro/ui/script/resetpw	4

4. Copy the password and use the password the next time you log into Metasploit.

You can change the password after you log in to Metasploit Pro.

5. Exit the console.

Deleting a User Account

If you have an administrator account, you can delete user accounts that you no longer need. When you delete a user account, the system reassigns the projects that belong to the account to the system. Any project that does not have a project owner will have system listed as the project owner.

1. Choose Administration > User Administration from the main menu.

Discovery Scan

One of the first steps in penetration testing is reconnaissance. Reconnaissance is the process of gathering information to obtain a better understanding of a network. It enables you to create list of target IP addresses and devise a plan of attack. Once you have a list of IP addresses, you can run a discovery scan to learn more about those hosts. A discovery scan identifies the operating systems that are running on a network, maps those systems to IP addresses, and enumerates the open ports and services on those systems.

A discovery scan is the internal Metasploit scanner. It uses Nmap to perform basic TCP port scanning and runs additional scanner modules to gather more information about the target hosts. By default, the discovery scan includes a UDP scan, which sends UDP probes to the most commonly known UDP ports, such as NETBIOS, DHCP, DNS, and SNMP. The discovery scan tests approximately 250 ports that are typically exposed for external services and are more commonly tested during a penetration test.

During a discovery scan, Metasploit Pro automatically adds the host data to the project. You can review the host data to obtain a better understanding of the topology of the network and to determine the best way to exploit each target. Oftentimes, the network topology provides insight into the types of applications and devices the target has in place. The more information that you can gather about a target, the more it will help you fine-tune a test for it.

How a Discovery Scan Works

A discovery scan can be divided into four distinct phases:

- Ping scan
- Port scan
- OS and version detection
- Data import

Ping Scan

The first phase of a discovery scan, ping scanning, determines if the hosts are online. The discovery scan sets the -PI option, which tells Nmap to perform a standard ICMP ping sweep. A single ICMP echo request is sent to the target. If there is an ICMP echo reply, the host is considered 'up' or online. If a host is online, the discovery scan includes the host in the port scan.

Port Scan

During the second phase, port scanning, Metasploit Pro runs Nmap to identify the ports that are open and the services are available on those ports. Nmap sends probes to various ports and classifies the responses to determine the current state of the port. The scan covers a wide variety of commonly exposed ports, such as HTTP, telnet, SSH, and FTP.

The discovery scan uses the default Nmap settings, but you can add custom Nmap options to customize the Nmap scan. For example, the discovery scan runs a TCP SYN scan by default. If you want to run a TCP Connect Scan instead of a TCP SYN Scan, you can supply the -sT option. Any options that you specify override the default Nmap settings that the discovery scan uses.

OS and Version Detection

After the discovery scan identifies the open ports, the third phase begins. Nmap sends a variety of probes to the open ports and detects the service version numbers and operating system based on how the system responds to the probes. The operating system and version numbers provide valuable information about the system and help you identify a possible vulnerability and eliminate false positives.

Data Import

Finally, after Nmap collects all the data and creates a report, Metasploit Pro imports the data into the project. Metasploit Pro uses the service information to send additional modules that target the discovered services and to probe the target for more data. For example, if the discovery scan sweeps a target with telnet probes, the target system may return a login prompt. A login prompt can indicate that the service allows remote access to the system, so at this point, you may want to run a bruteforce attack to crack the credentials.

Ports Included in the Discovery Scan

In total, the discovery scan includes over 250 ports, which includes the following set of ports:

- Standard and well known ports, such as ports 20, 21, 22, 23, 25 53, 80, and 443.
- Alternative ports for a service, such as ports 8080 and 8442, which are additional ports that HTTP and web services can use.
- Ports listed as the default port in a module.

If you do not see the port that you want to scan, you can manually add the port to the discovery scan. For example, if you know that your company runs web servers with port 9998 open, you need to manually add port 9998 to the discovery scan. This ensures that the discovery scan includes every port that is potentially open.

If you want to scan all ports, you can specify 1-65535 as the port range. Keep in mind that a discovery scan that includes all ports can take several hours to complete.

If there is a port that you do not want to scan, you can exclude the port from the discovery scan. The discovery scan will not scan any ports on the excluded list. For example, if your company uses an application that runs on port 1234, and you do not want to affect the application's performance, you can add the port to the excluded list.

Discovery Scan Options

You can configure the following options for a discovery scan:

Option	Description
Target addresses	Defines the individual hosts or network range that you want to scan.
Perform initial port scan	Performs a port scan before the discovery scan performs service version verification.
Custom Nmap arguments	Sends flags and commands to the Nmap executable. Discovery scan does not support the following Nmap options: -o, -i, -resume, -script, -datadir, and -stylesheet.
Additional TCP ports	Appends additional TCP ports to port scan. By default, the port scan covers a small, but wide range of ports. Use this option if you want to add more ports to the scan.
Excluded TCP ports	Excludes certain TCP ports from service discovery. By default, the port scan covers a specific range of ports. Use this option to add a port that you want to exclude from the scan.
Custom TCP port range	Specifies a range of TCP ports for the discovery scan to use instead of the default ports. If you set a custom TCP port range, the discovery scan ignores all default ports and uses the range that you define instead.
Custom TCP source range	Specifies the TCP source port that the discovery scan uses instead of the default port. Use this option to test firewall rules.
Fast detect: Common TCP ports only	Performs a scan on the most common TCP ports, which reduces the number of ports that the discovery scan scans.
	Controls the Nmap timing option. Choose from the following timing templates:
	Insane (5) - Speeds up the scan. Assumes that you are on a fast network and sacrifices accuracy for speed. The scan delay is less than 5 ms.
Portscan speed	Aggressive (4) - Speeds up the scan. Assumes that you are on a fast and reliable network. The scan delay is less than 10 ms.
	Normal (3) - The default port scan speed and does not affect the scan.
	Polite (2) - Uses less bandwidth and target resources to slow the scan.
	Sneaky (1) - The speed used for IDS evasion.

Option	Description
	Paranoid (0) - The speed used for IDS evasion.
Portscan timeout	Determines the amount of time Nmap spends on each host. The default value is 5 minutes.
UDP service discovery	Sets the discovery scan to find all services that are on the network. Metasploit uses custom modules instead of Nmap to perform UDP service discovery.
Scan SNMP community strings	Launches a background task that scans for devices that respond to a variety of community strings.
Scan H.323 video endpoints	Scans for H.323 devices.
Enumerate users via finger	Queries user names and attempts to bruteforce the user list if the discovery scan detects the Finger protocol.
Identify unknown services	Sets the discovery scan to find all unknown services and applications on the network.
Single scan: scan hosts individually	Runs a scan on individual hosts. The discovery scan scans the first host entirely and stores the information in the database before it moves onto the next host.
Dry run: only show scan information	If enabled, this option prepares the scan and shows all of the options that the Discovery Scan will use in the task log. However, it does not launch the scan.
Web scan: run the Pro Web Scanner	Automatically runs a web scan, web audit, and web exploit along with a discovery scan. It is generally recommended that you do not enable this option unless you are running a scan against a very small set of hosts. If you are running a discovery scan against a large number of hosts, you should run the web scanner separately from the discovery scan.
SMB user name	Defines the SMB user name that the discovery scan uses to attempt to login to SMB services.
SMB password	Defines the SMB password that the discovery scan uses to attempt to login to SMB services.
SMB domain	Defines the SMB server name and share name.

Specifying IPv6 Addresses

Metasploit Pro does not automatically detect IPv6 addresses during a discovery scan. For hosts with IPv6 addresses, you must know the individual IP addresses that are in use by the target devices and specify those addresses to Metasploit Pro. To identify individual IPv6 addresses, you can use SNMP, Nmap, or thc-alive6, which is part of the thc-ipv6 toolkit.

After you identify the IPv6 addresses for the target devices, you can either import a text file that contains the host addresses into a project or manually add the hosts to a project.

Importing a File that Contains IPv6 Addresses

To import a file, select **Analysis > Hosts**. When the Hosts page appears, click the **Import** button. When the Import Data page appears, browse to the location of the host address file and import the host address file. The file must be a text file that lists each IPv6 address on a new line, as shown below:

```
FE80:0000:0000:0202:B3FF:FE1E:8329
FE80:0000:0000:0202:B3FF:FE1E:8328
```

Manually Adding a Host with an IPv6 Address

To manually add a host, select **Analysis > Hosts**. When the Hosts page appears, click the **New Host** button.

Running a Discovery Scan

A discovery scan runs Nmap along with a few service specific modules to identify the systems that are alive and to find the open ports and services. At a minimum, you need to specify the addresses of the systems that you want scan. There are also advanced options that you can configure to fine-tune the different scan phases. For example, you can bypass the port scanning phase and move onto version

detection, or you can scan each host individually to accelerate the import of hosts into the project. Additionally, these advanced settings let you choose the ports, the target services, the scan speed, and the scan mode.

Since the discovery scan mostly leverages Nmap, you can specify additional Nmap options to customize the scan. For example, if you want to change the scanning technique, you can provide the Nmap command line option for the technique that you want to use, and the discovery scan applies those settings instead of the default ones. For more information on Nmap options, visit the Nmap documentation.

To run a discovery scan:

1. From within a project, click the **Overview** tab.

Note: You can also access the Scan button from the Analysis page.

2. When the Overview page appears, click the Scan button.

3. When the New Discovery Scan page appears, enter the target addresses that you want to include in the scan in the **Target addresses** field.

M metasploit*	Project	- default 🔻									Account - tdoan 🔻	Administration v	?	1
		Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Credentials	Reports	Exports	Tasks

Target Settings												* denotes r	equired fiel	d
		Target a	ddresses*	1.2.3.4 1.2.3.5 1.2.4.0/24							2			
						. Show Advant	ed Options							
												S Launch	Scan	

You can enter a single IP address, an address range, or a CIDR notation. If there are multiple addresses or address ranges, use a newline to separate each entry.

4. At this point, you can launch the scan. However, if you want to fine tune the scan, you can click the Show Advanced Options button to display additional options that you can set for the discovery scan. For example, you can specify the IP addresses that you want to explicitly include and exclude from the scan.

For more information about the scan options that are available, see Discovery Scan Options.

5. When you are ready to run the scan, click the Launch Scan button.

After the discovery scan launches, the task log displays and shows you the status of the progress and status of the scan. If the scan finishes without error, the status is 'complete'. Otherwise,

Viewing Scan Results

The best way to view the data collected by the Discovery Scan is from the Hosts page. To view the Hosts page, select **Hosts > Analysis**. Each host will have one of the following statuses:scanned, cracked, shelled, or looted. For recently scanned hosts, the easiest way to identify them to sort them by date and their status.

Data Gathered from a Discovery Scan

You'll notice that for each scanned or imported host, the following information is displayed, if available:

- The IP address
- The host name
- The operating system
- The active services
- · The timestamp when the host was last updated
- The host status

Decoding the Host Status

The host status describes the last current event that occurred with the host. There's a hierarchical order to the statuses.

- Scanned Indicates a discovery scan, Nexpose scan, or import was performed.
- Shelled Indicates that a session was opened on the host.
- Looted Indicates that
- Cracked

Vulnerability Scanning with Nexpose

Vulnerability scanning and analysis is the process that detects and assesses the vulnerabilities that exist within an network infrastructure. A vulnerability is a characteristic of an asset that an attacker can exploit to gain unauthorized access to sensitive data, inject malicious code, or generate a denial of service attack. To prevent security breaches, it is important to identify and remediate security holes and vulnerabilities that can expose an asset to an attack.

You can use Nexpose to scan a network for vulnerabilities. Nexpose identifies the active services, open ports, and running applications on each machine, and it attempts to find vulnerabilities that may exist based on the attributes of the known services and applications. Nexpose discloses the results in a scan report, which helps you to prioritize vulnerabilities based on risk factor and determine the most effective solution to implement.

Nexpose integrates with Metasploit Pro to provide a vulnerability assessment and validation tool that helps you eliminate false positives, verify vulnerabilities, and test remediation measures. There are a couple of ways that you can use Metasploit Pro with Nexpose. Metasploit Pro provides a connector that allows you to add a Nexpose Console so that you can run a vulnerability scan directly from the web interface and automatically import the scan results into a project. You can also run scans from Nexpose and import the scan reports into Metasploit Pro to perform vulnerability analysis and validation. You choose the method that works best for you.

Nexpose Terminology

Some terms in Nexpose differ from those used in Metasploit. Here are some Nexpose terms you should familiarize yourself with:

- Asset: A host on a network.
- Site: A logical group of assets that has a dedicated scan engine. A site can run over a long period of time and provide you with historical, trending data and is similar to a project in Metasploit.
- Scan Template: A template that defines the audit level that Nexpose uses to perform a vulnerability scan. For more information on scan templates, check out the Nexpose User Guide.

Downloading and Installing Nexpose

You can download the Community edition of Nexpose from the Rapid7 site. For more information on how to install and configure Nexpose, read this handy installation guide. If you are interested in Nexpose Enterprise, please contact the Rapid7 sales team.

Adding a Nexpose Console

Before you can run a Nexpose scan from Metasploit Pro, you must add a Nexpose Console. You'll need to know the address and port Nexpose runs on, and you'll need the credentials for an account that can be used to log into the Nexpose console.

To add a Nexpose Console:

1. Choose Administration > Global Settings from the main menu.

Projec	t 🔻				Account - tdoan 🔻	Administration V	?	22
						Software Updates		
						User Administration	_	
Home Projects						Software License		
						Global Settings		
Quick Start Wizards				Global Tools		0		
		•	Ø	Į.				
Quick PenTest	Phishing	Web App Test	Vulnerability	P	ayload Cust	om		
					Testing	Target		

2. Click the Nexpose Consoles tab.

Home	Global Settin	gs	
Global	Settings	SMTP Settings API Ke	ys Post-Exploitation Macros Persistent Listeners Nexpose Consoles Stop All Tasks
VALUE	CATEGORY	SETTING	DESCRIPTION
	Payloads	payload_prefer_https	Allow HTTPS-based payloads whenever possible (less reliable, but more stealthy)
	Payloads	payload_prefer_http	Allow HTTP-based payloads whenever possible (mostly reliable, traverses proxies)
	Debugging	allow_console_access	Allow access to the unsupported diagnostic console through the web browser (less secure). Press ctrl-tilde (~) to bring it up inside a project.
	Updates	automatically_check_updates	Automatically check for available updates
	Updates	use_http_proxy	Connect to the Internet via http proxy to check for software updates
	News Feed	enable_news_feed	Automatically update the news feed
😑 Updat	e Settings		

3. Click the Configure a Nexpose Console button.

ŀ	ome 💦 Global Set	tings					
	Global Settings	SMTP Settings API Keys Post-Exploitation Macros	Persistent Listeners	Nexpose Consoles	Stop All	Tasks	
Thi	section provides th	e ability to configure Nexpose Consoles. Once configured, these con:	soles may be used to launch new	scans and import data	from existing sit	es.	
	Configure a Nexpos	e Console 📋 Delete					
	NAME	ADDRESS	STATUS	VERSION	SITES	CREATOR	UPDATED
0) NX1	mspnexpose1.ms.scanlab.rapid7.com:3780	Available (Enabled)	490	14	msfadmin	2015-05-14 11:01:48 -0500

- 4. When the Nexpose configuration page appears, enter the following information:
 - <u>Console Address</u>: The IP or server address for the Nexpose instance.
 - <u>Console Port</u>: The port that runs the Nexpose service. The default port is 3780.
 - Console Username: The user name that will be used to log in to the console.
 - Console Password: The password that will be used to authenticate the account.
- 5. Select the **Enabled** option to initialize and activate the Nexpose Console.
- 6. Save the configuration.

The Nexpose Consoles table is updated with the console. If Metasploit Pro is able to successfully connect and authenticate to the Nexpose console, the status is 'Available (Enabled)', as shown below:

	Hom	e 🔷 Global Sett	ings Nexpose Consoles					
T	is se	ction provides the	e ability to configure Nexpose Consoles. Once configured, these cons	soles may be used to launch new	scans and import data	from existing sit	PS.	
	() (onfigure a Nexpose	Console 🔟 Delete					
		NAME	ADDRESS	STATUS	VERSION	SITES	CREATOR	UPDATED
		NX1	mspnexpose1.ms.scanlab.rapid7.com:3780	Available (Enabled)	490	14	msfadmin	2015-05-14 11:26:53 -0500

Otherwise, an 'Error' status displays if there is an issue with the console's configuration. The following errors may appear:

- 'Error: Nexpose host is unreachable' indicates that Metasploit Pro cannot access the console. You will need to verify that you have entered the correct address and port.
- 'Error: Authentication required for API access' indicates that the credentials that you have provided cannot be used to authenticate to the Nexpose server. You will need to verify that you have entered the correct credentials.

Running a Nexpose Scan

To be able to prioritize security risks, you must know what devices are running in an environment and understand how they are vulnerable to attacks. You can run a Nexpose scan to discover the services and applications that are running on a host and identify potential vulnerabilities that may exist based on the collected data. To learn how Nexpose works, check out the Nexpose User Guide.

All scan data collected from Nexpose is stored in a Metasploit project and can be viewed from the Analysis area. The information gathered from each host includes the IP address, host name, operating system, running services, and possible vulnerabilities. Metasploit Pro maps each vulnerability to a related module, if one exists in the module database for it. These modules are viewable from the Modules tab on the single host view.

To run a Nexpose scan:

- 1. From within a project, click the Overview or Analysis tab.
- 2. Click the Import button located in the Quick Tasks bar.
- 3. When the Import page appears, click the **Choose a Nexpose console** dropdown and select the console you want to use to run the scan.

The list shows Nexpose consoles that you have added to Metasploit Pro. If there are not any consoles available, please add a Nexpose console before you continue.

4. Enter the addresses you want to scan in the Scan targets field.

You can specify an IP address, an IP range, or a CIDR notation. Each item must be listed on a newline.

You can use standard IPv6 addressing to define individual IPv6 addresses. For example, use fe80::202:b3ff:fe1e:8329 for single addresses and 2001:db8::/32 for CIDR notations. For link local addresses, you must append the interface ID to the address. For example, enter fe80::1%eth0 for a link local address.

You can only scan the number of hosts for which you have licenses in Nexpose. If you provide more hosts than the number of licenses that you have available, the scan fails. For example, if you have a Community license, the most number of hosts Nexpose supports is 32. If you provide more than 32 hosts, the scan fails.

- 5. Click the **Scan template** dropdown and select a template. For more information on scan templates, please check out the Nexpose User Guide.
- If you do not want the scan to overwrite the data for existing hosts in the project, select the Don't change existing hosts option.
- 7. Click the Import data button to start the scan.

After the scan completes, select **Analysis > Hosts** to view the scan results.

Nexpose Scan Blackouts

A scan blackout prevents a Nexpose scan from taking place during a specific time period. If you attempt to run a Nexpose scan from Metasploit during a blackout, the scan will launch, but will show an error like the following in the task log:

Starting Nexpose Scan

```
[*] [2015.07.22-16:28:03] >> Created temporary site #27 Metasploit1234
[-] [2015.07.22-16:28:03] Auxiliary failed: Nexpose::APIError NexposeAPI:
Action failed:
[-] [2015.07.22-16:28:03] Call stack:
[-] [2015.07.22-16:28:03]
/Users/rapid7/pro/msf3/lib/rapid7/nexpose.rb:225:in `execute'
```

You must wait until the blackout is over to run the scan.

To find out when the blackout ends, log in to your Nexpose Console and do the following:

- 1. Go to the Administration page.
- 2. From the Scan Options, find the Global Blackouts category and select Manage.

3. Review the existing global and site blackout periods.

Importing Nexpose Data

If you prefer to run scans directly from the Nexpose Console, you can import the scan results to share the results and validate them with Metasploit Pro. When you import data from Nexpose, Metasploit Pro automatically indexes the vulnerability data from Nexpose by using the service and vulnerability reference ID to map each vulnerability to a matching exploit. The mapped exploits helps you to easily launch attacks against the vulnerability and to quickly determine if the vulnerability is a real risk or a false positive.

You can either import a site directly from a Nexpose Console or you can import a Nexpose Simple XML or XML export file.

Importing a Nexpose Simple XML or XML Export File

- 1. From within a project, click the Overview or Analysis tab.
- 2. Click the Import button located in the Quick Tasks bar.
- 3. When the Import Data page appears, select the Import from file radial button.
- 4. Click on the Choose file button to open the File Upload window.
- 5. When the File Upload window appears, browse to the location of the file you want to import, select it, and click the **Open** button.

Metasploit Pro supports the following Nexpose export types: XML Export, XML Export 2.0, and Nexpose Simple XML Export.

- 6. Configure any of the additional settings (optional):
 - Excluded Addresses: Enter any hosts you do not want to include in the import. You can enter a single host, an IP range, or a CIDR notation. Each item must appear on a new line.
 - **Don't change existing hosts**: Select this option if you do not want to overwrite the data for a host that already exists in the project.
 - Automatic tagging: Enter any tags you want to apply to the imported hosts. You can also select the Automatically tag by OS option to add an OS tag, such as 'os_windows', 'os_linux' or 'os_unknown' tag, to each imported host.
- 7. Click the Import Data button to start the import.

The task log appears and shows you the status of the import. When the import completes, the task log displays a 'Completed' status. To see the imported data, select **Analysis > Hosts** to go to the Hosts page.

Importing Existing Nexpose Sites

- 1. Open the project that you want to import data into.
- 2. From the Tasks bar, click the **Import** button. The **Import Data** page appears.
- 3. Select the Import from Nexpose option.
- 4. Click the **Choose a Nexpose Console** dropdown and select the console from which you want to import data.
- 5. Select the Import existing data option.
- 6. Select the site(s) you want to import from the Sites table.
- 7. Select **Do not change existing hosts** if you do not want to modify any existing hosts that are stored in the project.
- 8. Click the Import Data button to start the import.

The task log appears and shows you the status of the import. When the import completes, the task log displays a 'Completed' status. To see the imported data, select **Analysis > Hosts** to go to the Hosts page.

Importing Data

You can perform a data import to upload vulnerability scan data, query data from Project Sonar, or bring in data from other Metasploit projects. The import feature is useful if you have existing vulnerability data to validate or you have data that you want to share between projects.

Importing Data from Vulnerability Scanners

Metasploit allows you to import scan reports from third party vulnerability scanners, such as Nessus, Core Impact, and Qualys. When you import a scan report, host data, such as each host's operating system, services, and discovered vulnerabilities, is imported into the project.

To import a scan report from a third party vulnerability scanner:

- 1. From within a project, click the Overview or Analysis tab.
- 2. Click the Import button located in the Quick Tasks bar.
- 3. When the Import Data page appears, select the From file radial button.

ne test-4 Imports

- 5. When the File Upload window appears, browse to the location of the file you want to import, select it, and click the **Open** button.
- 6. Configure any of the additional settings (optional):
 - <u>Excluded Addresses</u>: Enter any hosts you do not want to include in the import. You can enter a single host, an IP range, or a CIDR notation. Each item must appear on a new line.
 - <u>Don't change existing hosts</u>: Select this option if you do not want to overwrite the data for a host that already exists in the project.
 - <u>Automatic tagging</u>: Enter any tags you want to apply to the imported hosts. You can also select the **Automatically tag by OS** option to add an OS tag, such as 'os_windows', 'os_linux' or 'os_unknown' tag, to each imported host.
- 7. Click the Import Data button to start the import.

The task log appears and shows you the status of the import. When the import completes, the task log displays a 'Completed' status. To see the imported data, select **Analysis > Hosts** to go to the Hosts page. Use the 'Updated' column to sort the hosts by last updated to see all recently imported hosts.

Supported Third Party Scan Reports

Metasploit supports most of the major scanners on the market, including Rapid7's own Nexpose, and other tools like Qualys and Core Impact. The following scan reports are supported:

- Foundstone Network Inventory XML
- Microsoft MBSA SecScan XML
- nCircle IP360 XMLv3 and ASPL
- NetSparker XML
- Nessus NBE
- Nessus XML v1 and v2
- Qualys Asset XML
- Qualys Scan XML
- Burp Sessions XML
- Burp Issues XML
- Acunetix XML
- AppScan XML
- Nmap XML
- Retina XML

- Amap Log
- Critical Watch VM XML
- IP Address List
- Libpcap Network Capture
- Spiceworks Inventory Summary CSV
- Core Impact XML

Metasploit Pro does not import service and port information from Qualys Asset files. If you import a Qualys Asset file, you must run a discovery scan to enumerate services and ports that are active on the imported hosts.

Importing Nexpose Data

If you prefer to run scans directly from the Nexpose Console, you can import the scan results to share the results and validate them with Metasploit Pro. When you import data from Nexpose, Metasploit Pro automatically indexes the vulnerability data from Nexpose by using the service and vulnerability reference ID to map each vulnerability to a matching exploit. The mapped exploits helps you to easily launch attacks against the vulnerability and to quickly determine if the vulnerability is a real risk or a false positive.

You can either import a site directly from a Nexpose Console or you can import a Nexpose Simple XML or XML export file.

Importing a Nexpose Simple XML or XML Export File

- 1. From within a project, click the Overview or Analysis tab.
- 2. Click the Nexpose button located in the Quick Tasks bar.
- 3. When the Import Data page appears, select the From file radial button.

Erom Novnoso	From file	
• Поличехрозе		
	No file selected	Choose
Excluded Addresses		

4. Click on the Choose file button to open the File Upload window.

			1
Automatic Tagging (Optional) 🔻			
		Don't change existing hosts	E Import Data

- When the File Upload window appears, browse to the location of the file you want to import, select it, and click the **Open** button. Metasploit Pro supports the following Nexpose export types: XML Export, XML Export 2.0, and Nexpose Simple XML Export.
- 6. Configure any of the additional settings (optional):
 - Excluded Addresses: Enter any hosts you do not want to include in the import. You can enter a single host, an IP range, or a CIDR notation. Each item must appear on a new line.
 - <u>Don't change existing hosts</u>: Select this option if you do not want to overwrite the data for a host that already exists in the project.
 - <u>Automatic tagging</u>: Enter any tags you want to apply to the imported hosts. You can also select the **Automatically tag by OS** option to add an OS tag, such as 'os_windows', 'os_linux' or 'os_unknown' tag, to each imported host.
- 7. Click the Import Data button to start the import.

The task log appears and shows you the status of the import. When the import completes, the task log displays a 'Completed' status. To see the imported data, select **Analysis > Hosts** to go to the Hosts page. Use the 'Updated' column to sort the hosts by last updated to see all recently imported hosts.

Importing Existing Nexpose Sites

- 1. From within a project, click the **Overview** or **Analysis** tab.
- 2. Click the **Nexpose** button located in the Quick Tasks bar.
- 3. When the Import Data page appears, select the From Nexpose radial button.

The task log appears and shows you the status of the import. When the import completes, the task log displays a 'Completed' status. To see the imported data, select **Analysis > Hosts** to go to the Hosts page. Use the 'Updated' column to sort the hosts by last updated to see all recently imported hosts.

Validating a Vulnerability

You've scanned your targets and identified potential vulnerabilities. The next step is to determine whether or not those vulnerabilities present a real risk. To validate a vulnerability, you have a couple of options:

• The Vulnerability Validation Wizard: The Vulnerability Validation Wizard provides an all-in-one interface that guides you through importing and exploiting vulnerabilities discovered by Nexpose. It enables you quickly determine the exploitability of those vulnerabilities and share that information with Nexpose. This feature is extremely handy if you use Nexpose to find and manage vulnerabilities.

Learn more about the Vulnerability Validation Wizard.

Manual Validation: Manual validation requires a bit more legwork than the wizard. This method
provides you with much more control over the vulnerabilities that are targeted. It is generally used when
you want to validate individual vulnerabilities or vulnerabilities discovered by other third-party scanners
like Qualys or Nessus.

When you perform manual validation, you will need to set up a penetration test as you normally would, which includes creating a project and adding vulnerability data via import or scan. Then, you need to try to exploit each vulnerability to determine whether or not they are valid threats. If the vulnerabilities were discovered by Nexpose, you have the option to send the results Nexpose.

Learn more about how you can validate vulnerabilities discovered by Nexpose.

Working with the Vulnerability Validation Wizard

Metasploit Pro simplifies and streamlines the vulnerability validation process. It provides a guided interface, called the Vulnerability Validation Wizard, that walks you through each step of the vulnerability validation process—from importing Nexpose data to auto-exploiting vulnerabilities to sending the validation results back to Nexpose. You can even define exceptions for vulnerabilities that were not successfully exploited and generate a report that details the vulnerability testing results directly from Metasploit Pro.

When you launch the Vulnerability Validation Wizard, you will need to configure the settings for the following tasks:

- Creating a project.
- Scanning or importing Nexpose sites.
- Tagging Nexpose assets. (optional)
- Auto-exploiting vulnerabilities.
- Generating a report. (optional)

Vulnerability Validation Terminology

The following are common terms related to vulnerability validation.

- Asset: The Nexpose term for a host or target.
- Asset groups: The Nexpose term for a group of hosts or targets.
- <u>Nexpose push</u>: The process of sending vulnerability exceptions or validated vulnerabilities back to Nexpose.
- Site: The Nexpose term for a collection of assets.
- <u>Validated vulnerability</u>: An vulnerability found by Nexpose that Metasploit Pro was able to successfully exploit and obtain a session.
- <u>Vulnerability</u>: A security flaw or weakness in an application or system that enables an attacker to compromise the target system.
- <u>Vulnerability exception</u>: A vulnerability found by Nexpose that Metasploit Pro was unable to exploit.
- <u>Vulnerability exception reason</u>: The reason why a vulnerability exists and why it should be excluded from the vulnerability assessment.
- <u>Vulnerability result code</u>: The reason why a module did not run successfully.
- Vulnerability validation: The process of identifying vulnerabilities that are exploitable.

Before You Begin

Before you can run the Vulnerability Validation Wizard, you will need to make sure that you have access to a Nexpose instance. You can only validate vulnerabilities with Metasploit Pro if you have Nexpose Enterprise or Nexpose Consultant version 5.7.16 or higher. Please check your Nexpose edition before attempting to use the Vulnerability Validation Wizard.

You must also have at least one site set up in Nexpose. To learn how to set up a site, please view the Nexpose Installation and Quick Start Guide.

Adding a Nexpose Console

You can configure a Nexpose console directly from the Vulnerability Validation Wizard. However, to simplify the vulnerability validation workflow, it is recommended that you globally add the Nexpose Consoles you intend to use prior to launching the wizard. When you globally add a Nexpose Console, it will be accessible to all projects and all users.

To configure a Nexpose Console:

- 1. Select Administration > Global Settings from the Administration menu.
- 2. Find the Nexpose Consoles area.

Nexp This se	ose Consoles ection provides the ability to config	ure Nexpose Consoles. Once configured, these cons	oles may be used to launch	new scans ar	nd import (data from exist	ing sites.
0	Configure a Nexpose Console 🛛	Delete

4. When the Configure a Nexpose Console page appears, enter the following information:

- Console Address The IP address to the server that runs Nexpose. You can also specify the server name.
- Console Port The port that runs the Nexpose service. The default port is 3780.
- Console Username The Nexpose user name that will be used to log in to the console.
- Console Password The Nexpose password that will be used to authenticate the user account.

5. Save the Nexpose Console.

Vulnerabilities Imported from Nexpose

The Vulnerability Validation Wizard only imports vulnerabilities that have matching Metasploit remotes exploit module that have a ranking of Great or Excellent. Because of this, you may see a large number of vulnerabilities that were discovered, but were not imported into your project because they did not have matching remote exploit modules that meet the required criteria.

Configuring and Running the Vulnerability Validation Wizard

The Vulnerability Validation Wizard simplifies and streamlines the vulnerability validation process for Nexpose users. It provides a guided interface that walks you through each step of the vulnerability validation process—from importing Nexpose data to auto-exploiting vulnerabilities to sending the validation results back to Nexpose. You can even generate a report that details the vulnerability validation test results and create exceptions for vulnerabilities that were not exploited.

Vulnerability Validation Wizard Workflow

To give you an idea of how you can configure the Vulnerability Validation Wizard, check out the workflow below:

Configuring and Running the Vulnerability Validation Wizard

1. From the Projects page, click on the **Vulnerability Validation** widget located under the Quick Start Wizards area. The Validate Vulnerabilities Wizard opens and displays the **Create Project** page.

metasploit [®]	Project ▼		Account - tdoan ▼ Administration	▼ ? <mark>1</mark>
Home Projects	duick PenTest	Phishing Campaign	Vildate Vildate	

2. In the **Project Name** field, enter a name for the project. The project name can contain any combination of alphanumeric characters, special characters, and spaces. You can also provide an optional description for the project, which typically explains the purpose and scope of the test.

Create Project	Project Name*	demo

		Excluded Ports	

- 13. Click the **Minimum Reliability** dropdown and choose the module ranking you want to use. You should use Great or Excellent.
- 14. Use any of the following options to configure exploitation settings:
 - Dry Run : Prints a transcript of the exploits in the attack plan without running them.
 - <u>Collect Evidence</u>: Collects loot, such as screenshots, system files, passwords, and configuration settings from open sessions.
 - Clean Up Sessions: Closes all sessions after all tasks have run.
 - <u>Payload Type</u>: Specifies the type of payload that the exploit will deliver to the target. Choose one of the following payload types:
 - Command: A command execution payload that enables you to execute commands on the remote machine.
 - Meterpreter: An advanced payload that provides a command line that enables you to deliver commands and inject extensions on the fly.
 - <u>Connection Type</u>: Specifies how you want your Metasploit instance to connect to the target. Choose one of the following connection types:
 - Auto: Automatically uses a bind connection when NAT is detected; otherwise, a reverse connection is used.

- Bind: Uses a bind connection, which is useful when the targets are behind a firewall or a NAT gateway.
- Reverse: Uses a reverse connection, which is useful if your system is unable to initiate connections to the targets.
- Listener Ports: Defines the ports that you want to use for reverse connections.
- Listener Host: Defines the IP address you want to connect back to.
- Auto Launch Macro: Specifies the macro that you want to run during post-exploitation.
- Concurrent Exploits: Specifies the number of exploit attempts you want to launch at one time.
- <u>Timeout in Minutes</u>: Defines the number of minutes an exploit waits before it times out.
- <u>Transport Evasion</u>: Choose from the following transport evasion levels:
- Low: Inserts delays between TCP packets.
- Medium: Sends small TCP packets.
- High: Sends small TCP packets and inserts delays between them.
- <u>Application Evasion</u>: Adjusts application-specific evasion options for exploits involving DCERPC, SMB and HTTP. The higher the application evasion level, the more evasion techniques are applied.
- Included Ports: Defines the specific ports you want to target for exploitation.
- Excluded Ports: Defines the specific ports you want to exclude from exploitation.
- 15. Click the **Generate Report** tab if you want to include an auto-generated report at the end of the vulnerability validation test. If you do not want to include a report, deselect the **Generate Report** option and skip to the last step.

22. Click the Launch button. The Findings window appears and shows the statistics for the test.

metasploit

Validating Vulnerabilities Discovered by Nexpose

The Vulnerability Validation Wizard provides a guided interface that walks you through pulling Nexpose vulnerabilities data into a project and exploiting them.

There are a couple of ways that you can bring Nexpose vulnerability data into a project through the Vulnerability Validation Wizard:

- Importing Existing Sites You can choose multiple sites from which you want to import hosts. Metasploit Pro pulls all of the hosts and their associated vulnerability information from the selected sites and stores their information in a project. Metasploit Pro only imports vulnerabilities for which it has matching exploit modules. For more information on how to import and exploit vulnerabilities with the Vulnerability Validation Wizard, see Importing and Exploiting Nexpose Vulnerabilities on page 91.
- Running a Nexpose Scan You can specify the hosts that you want to scan for vulnerabilities. Metasploit Pro creates a new site on Nexpose and adds the hosts to them. Nexpose scans the hosts for vulnerabilities. After the Nexpose scan completes, Metasploit Pro imports the vulnerabilities for which it has matching exploit modules. For more information on how to scan for vulnerabilities and exploit them with the Vulnerability Validation Wizard, see *Scanning Nexpose Sites and Exploiting Vulnerabilities* on page 102.

Importing and Exploiting Nexpose Vulnerabilities

- 1. Log in to the Metasploit Pro web interface.
- When the Projects page appears, find the Quick Start Wizards and click on the Validate Vulnerabilities widget. The Validate Vulnerabilities Wizard opens and displays the Create Project page.

3. In the **Project Name** field, enter a name for the project. The project name can contain any combination of alphanumeric characters, special characters, and spaces. You can also provide a description for the project, which typically explains the purpose and scope of the test. This field is optional.

reate Project	Project Name*	demo	
Pull from Nexpose	Description	Imports assets from demo site and exploits vulnerabilities.

20. Click the Launch button. The Findings window appears and shows the statistics for the test.

Matching Metasploit Exploits to Nexpose Vulnerabilities

Metasploit Pro only matches vulnerabilities from Nexpose for which it has remote exploit modules. However, since Nexpose includes all local exploits, auxiliary modules, and browser exploits when it matches vulnerabilities to modules, this number may not match the number of vulnerabilities imported from Nexpose.

This is important to remember when you are looking at the Findings window. You will see a different number of vulnerabilities imported than number of exploit matches.

Scanning Nexpose Sites and Exploiting Vulnerabilities

- 1. Log in to the Metasploit Pro web interface.
- When the Projects page appears, find the Quick Start Wizards and click on the Validate Vulnerabilities widget. The Validate Vulnerabilities Wizard opens and displays the Create Project page.

3. In the **Project Name** field, enter a name for the project. The project name can contain any combination of alphanumeric characters, special characters, and spaces. You can also provide a description for the project, which typically explains the purpose and scope of the test. This field is optional.

Sharing Validation Results with Nexpose

The process of sharing vulnerability validation results with Nexpose is called pushing.

During a push, validated vulnerabilities are marked as exploited on the asset's Vulnerabilities list and the non-exploitable vulnerabilities are added to the Vulnerability Exceptions and Policy Overrides page. The ability to push to Nexpose makes it easy to track and prioritize the vulnerabilities that have already been tested.

There are a couple of ways that you can share results with Nexpose:

- <u>Using the Vulnerability Validation Wizard</u>: The wizard provides an option to push validations and exceptions directly from the Findings page.
- <u>Performing a manual push</u>: You can push validations and exceptions from either the Vulnerabilities Index or the Vulnerability Details Page if you are manually validating Nexpose sourced vulnerabilities.

Validation Results

There are two sets of results that you can share with Nexpose: validated vulnerabilities and vulnerability exceptions.

Validated Vulnerabilities

A validated vulnerability is a vulnerability that Metasploit was able to successfully exploit to obtain a session on the target. A validated vulnerability will have a validated icon next to it on the asset page's Vulnerabilities list in Nexpose, as shown below:

Vulnera	abilities								▼ x
View de select t	tails about discovered vulnerabilities. To use on the top row and use Select Visible. Cancel all s	one of the elections	e excepti s using C	on control: Clear All. 🌘	s on a vulnerability,	select a row. To use the	e control with a	all displayed displa	yed vulnerabilities,

Exclud	le Recall Resubmit							Total Vulnerabili	ties Selected: 0 of 137
	Title	₩	-1 🚺	CVSS	Risk	Published On	Severity	Instances	Exceptions
	MS11-050: Cumulative Security Update for Internet Explorer (2530548)	\ 🔂	W	9.3	697	Thu Jun 16 2011	Critical	1	Ø Exclude
	MS12-063: Cumulative Security Update for Internet Explorer (2744842)	쓮	6	9.3	562	Tue Sep 18 2012	Critical	1	Ø Exclude
	MS13-069: Cumulative Security Update for Internet Explorer (2870699)		φ.	9.3	300	Tue Sep 10 2013	Critical	1	Ø Exclude
	MS13-059: Cumulative Security Update for Internet Explorer (2862772)		Ŵ	9.3	311	Tue Aug 13 2013	Critical	1	Ø Exclude
	MS13-055: Cumulative Security Update for Internet Explorer (2846071)		Ŵ	9.3	327	Tue Jul 09 2013	Critical	1	Ø Exclude

This simply lets you know that the vulnerability has been tested and was successfully exploited by Metasploit.

Vulnerability Exceptions

A vulnerability exception is vulnerability found by Nexpose that Metasploit was unable to exploit. Generally, vulnerability exceptions represent vulnerabilities that are typically low-risk or are used deliberately to mitigate bigger threats. You can create vulnerability exceptions to exclude certain vulnerabilities from a report so that you can manage your risk score.

Vulnerability exceptions should be created for vulnerabilities that have a status of 'Not Exploitable', which indicates that Metasploit was unable to obtain a session on the target. The inability to exploit a vulnerability is typically due to compensating controls or back porting.

Here are some reasons why you may want to create a vulnerability exception:

- The vulnerability is used as compensating controls or to mitigate additional risks.
- The vulnerability exists due to an acceptable use case or deliberate practice, such as anonymous FTP access.
- The vulnerability represents an acceptable risk and may require more resources than you are willing to invest to remediate. This type of vulnerability typically poses a minimal risk.
- The vulnerability is a false positive.

Understanding Statuses

All vulnerabilities imported from Nexpose have a status. The status lets you easily determine if the vulnerability has been tested and the results of the test. The status you see for a particular vulnerability depends on whether you are viewing the Vulnerabilities Index or the Vulnerability Details Page.

Statuses on the Vulnerabilities Index

The Vulnerabilities Index lists all vulnerabilities for all hosts in the project. From the Vulnerabilities Index, you can quickly determine if any action has been taken against the vulnerability. Any action taken against the vulnerability affects the test status, which identifies whether or not an exploit has successfully compromised the target.

To identify the test status for a vulnerability, look at the **Nexpose Test Status** column in the Vulnerabilities Index, as shown below:

[Hon	ne test2 Vulnerabilities				
	===	Grouped View Delete Vulner	abilities 📎	Tag Hosts 🛛 🐒 Scan 🔄 Import 🔯 Nexpose Scan 🕉 WebSca	n 😵 Modules 🔒 Brute	eforce 😵 Exploit Search Vulnerabilities 🔍

						Vulnerabilities Create Exception V
		HOST	SERVICE	NAME	NEXPOSE TEST STATUS	REFERENCES
		ms-w03r2-3u- 1.ms.scanlab.rapid7.com	445/tcp	MS08-067: Vulnerability in Server Service Could Allow Remote Code Execution (958644)	Exploited	82 CVE-2008-4250 (5 Total)
		ms-w03r2-3u- 1.ms.scanlab.rapid7.com	139/tcp	MS08-067: Vulnerability in Server Service Could Allow Remote Code Execution (958644)	Exploit Attempted	EVE-2008-4250 (2 Total)
		ms-w03-3u- 1.ms.scanlab.rapid7.com	139/tcp	MS09-001: Vulnerabilities in SMB Could Allow Remote Code Execution (958687)	Not Tested	😢 CVE-2008-4114 (3 Total)

The following statuses are available:

 <u>Not tested</u>: An exploit has not been run against the target. This status is common for vulnerabilities that have been newly added to a project via import or Nexpose scan.

If the vulnerability was imported by the Vulnerability Validation Wizard, this status indicates that a matching remote exploit module with a ranking of great or higher was not found for the vulnerability, so no exploits were run. There may be exploit modules with a lower ranking or auxiliary modules that you can run manually against the vulnerability to test for exploitability. To check for matching exploit modules that can be run against the vulnerability, go to the Vulnerability Details Page and view the **Related Modules** tab.

• Exploit attempted: An exploit has been run against the target, but the exploit attempt was unsuccessful. A vulnerability with a status of 'Exploit Attempted' will have a failed module run result.

If the vulnerability was imported by the Vulnerability Validation Wizard, this status indicates that a matching remote exploit module with a ranking of great or higher was found and run against the vulnerability, but the exploit attempt was unsuccessful.

For any vulnerability that has an 'Exploit Attempted' status, you can choose to mark it as 'Not Exploitable' if you know that the vulnerability is not a valid risk. When you mark a vulnerability as 'Not Exploitable', the vulnerability is marked in Nexpose as an exception.

- <u>Not Exploitable</u>: This status indicates that you have determined that the vulnerability cannot be exploited. Any vulnerability with a 'Not Exploitable' status can be pushed to Nexpose as a vulnerability exception.
- <u>Exploited</u>: An exploit was able to successfully compromise the target and open a session. Any vulnerability with an 'Exploited' status can be pushed to Nexpose as a validated vulnerability.

Statuses on the Vulnerability Details Page

The Vulnerability Details Page provides a more comprehensive look at a particular vulnerability. You can see a history of all actions taken against the vulnerability, identify other hosts with the same vulnerability, and find exploits that you can run against the vulnerability.

The Overview tab lists all the exploits that have been run against the vulnerability. The statuses on the Vulnerability Details Page indicate the results of a module run.

8-067: Vulnerability in Server Sen	ice Could Allow Remote Code Execution (958644)	HOST <u>10 20 36 53</u> (emb) me-w03r2-3u-1.me.scanlab.rapid7.com	REFERENCES // CVE-2008-4250 MS08-067 Isplid7 OSVD8-49243 Mod

ACTION DESCRIPT	ON		

The following statuses are available:

- Unreachable: Metasploit cannot communicate with the host.
- Failed: The module was unable to open a session on the target.
- · Exploited: The exploit was able to successfully open a session on the target.
- Not Exploitable: The exploit failed to open a session, and you manually marked the vulnerability as 'Not Exploitable'.
- <u>No status available</u>: The vulnerability was not tested. This status typically indicates that there were not any matching remote exploits available for the vulnerability.

Understanding Result Codes

A result code provides the reason why an exploit failed. If you see a 'Failed' status for a module run, you can hover over the status to see the result code, which can help you troubleshoot the issue.

Home 🔰 test2 🚽 Hosts 🚽 10 20.36.53 - ms-w03/2-3u-1 ms.scanlab.rapid7.com 🎾 MS08-067; Vulnerability in Serve	er Service Could Allow Remote Code Execution (958644)

Show 20 Showing 1 - 1 of 1	no-access	

The following result codes are available:

- None: Indicates that Metasploit could not determine if the module ran successfully or failed.
- <u>Unknown</u>: Indicates that Metasploit could not determine if the module ran successfully or failed.
- Unreachable: Indicates that Metasploit could not reach the network service.

- Bad-config: Indicates that the exploit settings were configured incorrectly.
- Disconnected: Indicates that the network service disconnected during a module run.
- Not-found: Indicates that Metasploit could not find the application or service.
- <u>Unexpected-reply</u>: Indicates that Metasploit did not receive the expected response from the application.
- Timeout-expired: Indicates that a timeout occurred.
- User-interrupt: Indicates that the user stopped the module run.
- No-access: Indicates that Metasploit could not access the application.
- No-target: Indicates that the module configuration was not compatible with the target.
- Not-vulnerable: Indicates that the application was not vulnerable.
- Payload-failed: Indicates that Metasploit delivered a payload, but was unable to open a session.

Marking a Vulnerability as Not Exploitable

You can manually assign a **Not exploitable** status for any vulnerability that has a Nexpose test status of 'Exploit attempted'. The 'Not exploitable' status implies that the vulnerability does not present a real risk and can be treated as an exception.

You can only assign a 'Not exploitable' status to a vulnerability that has a Nexpose test status of 'Exploit attempted'. After you push the vulnerability to Nexpose, you cannot change its status back to 'Exploit Attempted'. Any changes that you make to the vulnerability from the Nexpose console will not be updated in Metasploit.

Pushing Validated Vulnerabilities

Pushing validated vulnerabilities is a one-button process. When you are ready to push validated vulnerabilities back to Nexpose, there are a few ways that you can do it:

- From the Vulnerability Validation Wizard's Findings
- From the Vulnerabilities Index
- From the Vulnerability Details Page

To push validations to Nexpose, you must add an active Nexpose console that Metasploit can reach. See this page to learn how to configure a Nexpose console.

Pushing Validated Vulnerabilities from the Vulnerability Validation Wizard's Findings

When the Vulnerability Validation Wizard finishes its run, you will be able to push validated vulnerabilities to Nexpose. The process of pushing validated vulnerabilities to Nexpose simply requires clicking the **Push Validations** button located on the Findings window, which is only active if there are valid vulnerabilities to send to Nexpose.

The image below shows the active **Push Validations** button:

Home kittens for your face Tasks	Fask 3

Pushing Validated Vulnerabilities from the Vulnerabilities Index

The Vulnerabilities Index lists all vulnerabilities for all hosts in the project and enables you to quickly determine the current test status for a particular vulnerability. The index view is useful for pushing multiple validations at the same time.

To push validations from the Vulnerabilities Index:

- 1. From within a project, select Analysis > Vulnerabilities. The Vulnerabilities Index appears.
- 2. Select the vulnerabilities with a Nexpose Test Status of 'Exploited' that you want to push to Nexpose as a validation.
- 3. Click the Push to Nexpose button.

 A dialog window appears and alerts you that you have selected exploited vulnerabilities sourced from Nexpose that will be pushed to Nexpose as validations. Click **Push** to accept the warning and proceed with the push.

The Task Log appears and shows you when the push is complete.

Home kittens for your face Tasks Task 4		🛔 Bruteforce 🚱 Exploit
Nexpose Push Exceptions and Validations	🖌 Completed	Started: 2015-02-23 15:09:04 -0600 Duration: less than 5 seconds
 [*] [2015.02.23-13:09:05] Pushing Mexpose Validations [*] [2015.02.23-13:09:05] Successfully pushed validations to Mexpose. 		

After you push the validations to Nexpose, any vulnerability that was successfully exploited by that have been exploited will be marked as validated in your Nexpose console, as shown below:

Pushing a Single Validated Vulnerability

You can push from the Vulnerability Details Page if you want to push a specific validation back to Nexpose.

To push validations from the Vulnerability Details Page:

- 1. From within a project, select **Analysis > Vulnerabilities**. The Vulnerabilities Index appears.
- 2. Find the validated vulnerability you want to push to Nexpose and click on the name to open the Vulnerability Details Page. Validated vulnerabilities will have a status of 'Exploited'.

Overview Related Modules Related Hosts		□ N	
			Mark as Not Exploitable
Comments			
ACTION DESCRIPTION	▼ STA	TUS USER	TIME
Exploit Run Module <u>MS08-067 Microsoft Server Service Relative Path Stack Corruption</u>	E	xploited tdoan	2015-03-06 21:03:40

- 3. Click the Push to Nexpose button.
- 4. When the confirmation window appears, click OK to push the validation to Nexpose.

If Metasploit is unable to reach the Nexpose console, an error message appears and alerts you that there is an issue with the console. You can click **OK** to try the push again. If the error continues to persist, you will need to close the modal and diagnose the console connectivity.

Creating and Pushing Vulnerability Exceptions

When you are ready to create and push vulnerability exceptions, you can do it from a few different areas in the application:

- From the Vulnerability Validation Wizard's Findings
- From the Vulnerabilities Index
- From the Vulnerability Details Page

I To push exceptions to Nexpose, you must have an active Nexpose console set up that Metasploit can reach.

As previously mentioned, a vulnerability exception is vulnerability found by Nexpose that Metasploit was unable to exploit. To create a vulnerability exception, you, must manually change the status of a vulnerability from 'Exploit Attempted' to 'Not Exploitable'.

When you create a vulnerability exception, you must set an expiration date that determines when the exception will no longer be effective and provide a reason that explains why the exception exists.

An exception can have one of the following reasons:

- False positive: Indicates that the vulnerability does not exist.
- <u>Compensating control</u>: Indicates that the vulnerability is a compensating control, or a workaround for a security requirement.
- <u>Acceptable use</u>: Use this exception reason for any vulnerability that is used as part of organizational practices.
- <u>Acceptable risk</u>: Indicates that the vulnerability is considered low risk. These vulnerabilities tend to pose minimal security risk and are likely to consume more resources than they are worth.
- <u>Other</u>: Indicates that the vulnerability has a custom exception reason. If you select **Other**, you can provide a custom exception reason in the **Comment** field.

Pushing Vulnerability Exceptions to Nexpose from the Vulnerability Validation Wizard's Findings

The Vulnerability Validation Wizard makes it extremely easy for you to push validations to Nexpose. When the Vulnerability Validation Wizard finishes its run, the **Push Exceptions** button appears on the Findings window if Metasploit was unable to exploit any of the tested vulnerabilities. You can click the **Push Exceptions** button to open the Create Nexpose Exceptions page. From this page, you will be able to create and push vulnerability exceptions.

To push exceptions from the Vulnerability Validation Wizard's Findings:

 Click the Push Exceptions button located on the Findings window. The Create Nexpose Exceptions page appears.

2. Select the hosts that you want to create exceptions for. Use the **Select All Hosts** checkbox if you want to create exceptions for all hosts that have a non-exploitable vulnerability.

KCEPTION SETTINGS			
		 Automatically Approve 	V Push Exceptions

The task log appears and shows you the status of the push. If the push is successful, the message 'Successfully pushed exceptions to Nexpose' appears in the task log.

Home > kittens for your face > Tasks > Task 3		👔 Bruteforce 🔇 Exploit
Nexpose Push Exceptions and Validations	V Completed	Started: 2015-02-24 10:43:42 -0600 Duration: less than 5 seconds
[*] [2015.02.24-08:43:42] Pushing Nexpose Exceptions [*] [2015.02.24-08:43:44] Successfully pushed exceptions to Nexpose.		

If Metasploit is unable to reach the Nexpose console, an error message appears and alerts you that there is an issue with the console. You can click **OK** to try the push again. If the error continues to persist, you will need to close the modal and diagnose the console connectivity.

Updating Vulnerability Exceptions in Nexpose

At some point, you may want to update vulnerability validations and exceptions after they have been pushed from Metasploit to Nexpose. In order to update vulnerability validations and exceptions after they have been pushed to Nexpose, you must log in to the Nexpose Console and manually update them. Currently, there is no way to update them from Metasploit. For more information on how to manage exceptions, please take a look at the Nexpose User's Guide.

Tracking Real-Time Statistics and Events

The Findings window displays the real-time statistics for the test and the task log. You can click on the tabs at the top of the Findings window to switch between the real-time statistics and the task log. You can also automatically push validated vulnerabilities and access the Vulnerabilities Exceptions configuration page.

Accessing the Findings Window

The Findings window automatically appears when you start the Vulnerability Validation Wizard. If you navigate away from the Findings window, you can go to the Tasks page to access it again.

To access the Findings Window:

- 1. From within a project, select **Tasks > Show Tasks** from the Project Tab bar. The Tasks page appears.
- 2. Find the Vulnerability Validation task.

	Project - demo ▼	Account - HD_Moore ▼ Administration ▼ ? 2			
	Overview Analysis Sessions Modules Credentials	Reports Exports Tasks			
Home demo Tasks

From the Statistics tab, you can track the following data:

- The total number of hosts that have been scanned or imported.
- The total number of unique vulnerabilities that have been identified.
- The total number of exploit modules that match Nexpose vulnerabilities.
- The total number of vulnerabilities that Metasploit Pro was able to exploit.
- The total number of vulnerabilities that Metasploit Pro was unable to exploit.

Viewing a List of Imported Hosts from the Findings Window

- 1. Open the Findings window.
- 2. Click on the **Hosts Imported** tab. The Hosts list appears and displays the IP addresses for each host that has been imported from a Nexpose site.

3. Use the navigational page buttons to view more hosts or click the **Show Entries** dropdown to expand the number of exceptions displayed.

The Tasks Log Tab

The Tasks Log tab shows a detailed activity log for the Vulnerability Validation Wizard. Each task that Metasploit Pro performs is documented in the Tasks Log. For example, you can view the assets and vulnerability definitions as they are being imported into a project or you can view the exploit modules as they are being run. If you have chosen to perform a dry run of the auto-exploitation task, you can go to the Tasks Log to view the proposed attack plan.

Additionally, the Tasks log shows you the current state of the test, the start time of the test, and the amount of time that the test has been running.

Exploitation

An exploit executes a sequence of commands that target a specific vulnerability found in a system or application to provide the attacker with access to the system. Exploits include buffer overflow, code injection, and web application exploits.

Metasploit Pro offers automated exploits and manual exploits. The type of exploit that you use depends on the level of granular control you want over the exploits.

Automated Exploits

When you run an automated exploit, Metasploit Pro builds an attack plan based on the service, operating system, and vulnerability information that it has for the target system. Automated exploits cross reference open ports, imported vulnerabilities, and fingerprint information with exploit modules. The attack plan defines the exploit modules that Metasploit Pro will use to attack the target systems.

An automated exploit uses reverse connect or bind listener payloads and does not abuse normal authenticated control mechanisms.

To run an automated exploit, you must specify the hosts that you want to exploit and the minimum reliability setting that Metasploit Pro should use. The minimum reliability setting indicates the potential impact that the exploits have on the target system. If you use a high ranking, such as excellent or great, Metasploit Pro uses exploits that will be unlikely to crash the service or system. Exploits that typically have a high reliability ranking include SQL injection exploits, web application exploits, and command execution exploits. Exploits that corrupt memory will most likely not have a high reliability ranking.

You can also specify the payload type that you want the exploit to use. By default, automated exploits use Meterpreter, but you can choose to use a command shell instead.

Running Automated Exploits

- 1. From within a project, click the Analysis tab.
- 2. When the Hosts window appears, select the hosts that you want to exploit and click the **Exploit** button.
- 3. When the New Automated Exploitation Attempt window appears, verify that target address field contains the addresses that you want to exploit.
- 4. Select the minimum reliability for the exploit.
- 5. Define the hosts that you want to exclude from the exploit.

- 6. Define the payload options. This determines the type of payload the exploit uses, the type of connection the payload creates, and the listener ports that the exploit uses.
- 7. Define the exploit selection options. This determines the ports that the exploit includes and excludes from the attack.
- 8. Define the advanced options. The advanced options lets you define the number of exploits you can run concurrently, the time out for each exploit, and evasion options.
- 9. Run the exploit.

Configuring Auto-Exploitation Options

The following options can be configured for exploitation:

Dry Run: Prints a transcript of the exploits in the attack plan without running them.

<u>Collect Evidence</u>: Collects loot, such as screenshots, system files, passwords, and configuration settings from open sessions.

Clean Up Sessions: Closes all sessions after all tasks have run.

<u>Payload Type</u>: Specifies the type of payload that the exploit will deliver to the target. Choose one of the following payload types:

- Command: A command execution payload that enables you to execute commands on the remote machine.
- Meterpreter: An advanced payload that provides a command line that enables you to deliver commands and inject extensions on the fly.
- PowerShell: A payload type that can be used to open a PowerShell session and run a PowerShell script. PowerShell sessions are only supported on Windows targets.

<u>Connection Type</u>: Specifies how you want your Metasploit instance to connect to the target. Choose one of the following connection types:

- Auto: Automatically uses a bind connection when NAT is detected; otherwise, a reverse connection is used.
- Bind: Uses a bind connection, which is useful when the targets are behind a firewall or a NAT gateway.
- Reverse: Uses a reverse connection, which is useful if your system is unable to initiate connections to the targets.

Listener Ports: Defines the ports that you want to use for reverse connections.

Listener Host: Defines the IP address you want to connect back to.

Auto Launch Macro: Specifies the macro that you want to run during post-exploitation.

Concurrent Exploits: Specifies the number of exploit attempts you want to launch at one time.

Timeout in Minutes: Defines the number of minutes an exploit waits before it times out.

Transport Evasion: Choose from the following transport evasion levels:

- Low: Inserts delays between TCP packets.
- Medium: Sends small TCP packets.
- High: Sends small TCP packets and inserts delays between them.

<u>Application Evasion</u>: Adjusts application-specific evasion options for exploits involving DCERPC, SMB and HTTP. The higher the application evasion level, the more evasion techniques are applied.

Included Ports: Defines the specific ports you want to target for exploitation.

Excluded Ports: Defines the specific ports you want to exclude from exploitation.

Manual Exploits

A manual exploit is a module that you can select and run individually. You perform a manual exploit when you want to exploit a known vulnerability.

You choose the exploit module based on the information you have about the host. For example, if you know that the host runs Windows Service Pack 1, you can run an exploit that targets Windows Service Pack 1 vulnerabilities. Or if you know that the target system has a specific vulnerability that you want to test, you can run the exploit that targets that particular weakness.

Manual exploitation provides granular control over the module and evasion options that an exploit uses. Whereas automated exploits enable you to run simultaneously multiple exploits, manual exploits enable you to run one exploit at a time.

The options and instructions that you perform for manual exploits vary based on the exploit that you choose to run. Therefore, use the following instructions as a guideline to manually run exploits.

Searching for Exploits

The module search engine searches the module database for the keyword expression and returns a list of results that match the query. Use the module search engine to find the module that you want to run against a target system.

- 1. From within a project, click the Modules tab.
- 2. In the Search Modules field, enter a keyword expression to search for a specific exploit.
- 3. Use the keyword tags to define the keyword expression.
- 4. Press Enter to perform the search.

Module Rankings

Module rankings provide details about the reliability and impact of an exploit on a target system. Every module in the Metasploit Framework has a ranking, which is based on how likely the exploit will disrupt the service.

There are six possible rankings. The higher rankings indicate that the exploit is less likely to cause instability or crash the target system.

Use the following rankings to determine the reliability of a module:

- <u>Excellent</u>: The exploit will never crash the service. This is the case for SQL Injection, CMD execution, RFI, LFI, etc. No typical memory corruption exploits should be given this ranking unless there are extraordinary circumstances (WMF Escape()).
- <u>Great</u>: The exploit has a default target AND either auto-detects the appropriate target or uses an application-specific return address AFTER a version check.
- <u>Good</u>: The exploit has a default target and it is the "common case" for this type of software (English, Windows XP for a desktop app, 2003 for server, etc).
- <u>Normal</u>: The exploit is otherwise reliable, but depends on a specific version and can't (or doesn't) reliably autodetect.
- Average: The exploit is generally unreliable or difficult to exploit.
- Low: The exploit is nearly impossible to exploit (or under 50%) for common platforms.

Setting Up a Listener

- 1. Select Administration > Global Settings from the main menu.
- 2. Click New Listener, which is located under Persistent Listeners.
- 3. When the Create a Listener window appears, choose an associated project for the listener.
- 4. Define the listener payload type.
- 5. Enter an IP address for the listener.
- 6. Enter a port for the listener.
- 7. Choose a post-exploitation macro to deploy after the listener connects to the target system. Enable the listener.
- 8. Save the listener.

The Payload Generator

The Payload Generator enables you to create a properly formatted executable that you can use to deliver shellcode to a target system without the use of an exploit. The Payload Generator provides a guided interface that walks you through the process of generating a dynamic payload or a classic payload. Depending on the type of payload you choose to build, it will display the applicable options that you can use to customize the payload.

You use the payload generator when you need to build a standalone binary file that delivers a custom-built payload. Binary files, such as .exe and .bin files, are typically delivered through client-side exploits, such as phishing e-mails or social engineering attacks, which means that you will probably need to be able to bypass anti-virus detection to execute the shellcode on the target system. To help reduce anti-virus detection, the Payload Generator enables you to do things like encode the payload and use a dynamic executable.

Payloads are generated globally, outside the context of a project. This means that payloads are generated on the fly, can only be downloaded once, and are not tied to a particular project. They are useful when you need to quickly generate a executable payload for a single use.

Accessing the Payload Generator

You access the Payload Generator from the Global Tools area of the web interface. To access the Payload Generator, go to the Projects List. Find the Global Tools area and click on the **Payload Generator** widget to launch it.

Show	ing 1 to 5 of 5 entr	ies					First Previous 1	Next Last	On Saturday, March 8th, @julianvilas and I spoke at RootedCON about our work with the Yokogawa CENTUM CS3000 product. Today, as promised, we're publishing details for three of the vulnerabilities found in the product. For all of you who weren't able to attend RootedCON, we're going just to quote

Building Dynamic Payloads

The Payload Generator enables you to build a Windows executable that uses a dynamic stager that is written entirely in randomized C code. The dynamic stager does not use an executable template or shellcode, which allows it to behave similarly to a standard Windows application. The resulting executable it is different each time it is generated, so that anti-virus software will not be able to identify the stager as Metasploit shellcode.

Note: Metasploit Pro offers dynamic payloads for Windows platforms only. These payloads are compatible with any Windows x86 and x86_64 system.

Dynamic Payload Options

Type of Payload

This is type of payload that the exploit will deliver to the target. Choose one of the following payload types:

- **Command** A command execution payload that enables you to execute commands on the remote machine.
- **Meterpreter** An advanced payload that provides a command line that enables you to deliver commands and inject extensions on the fly.

Stager

The stager is what the payload uses to set up the network connection between the target machine and the payload handler running on the Metasploit server. The stager enables you to use a smaller payload to load and inject a larger, more complex payload called the stage.

Choose one of the following stagers:

- Reverse TCP Creates a connection from the target machine back to the Metasploit server over TCP.
- Bind TCP Binds a command prompt to a listening port on the target machine so that the Metasploit server can connect to it.
- Reverse HTTP Creates a connection from the target machine back to the Metasploit server over HTTP.
- Reverse HTTPS Creates a connection from the target machine back to the Metasploit server over HTTPS.

Stage

Specifies the payload that is delivered by the stager.

LHOST

Defines the IP address the payload connects back to. (Reverse connections only)

LPORT

Defines the port the payload connects back to.

RHOST

Defines the port that the listener binds to. (Bind connections only)

Generating Dynamic Payloads

1. From the Projects page, launch the Payload Generator.

metasploit [®]	pject ▼				Account -	tdoan 🔻 Administration	▼ ? 0
Home Projects Quick Start Wizards Quick PenTest	Phishing Campaign	Web App Test	Vulnerability Velidation	Global Tools	Payload Generator	Segmentation Target Serup Script	

2. Select the Dynamic Payload option.

Payload Options	Stager	werse_tcp 🔻	
	Stage	indows/meterpreter	
	LH0ST*		?
	LPORT* 4	444	(?)

3. Click the **Stager** dropdown and choose one of the following: Reverse TCP, Bind TCP, Reverse HTTP, or Reverse HTTPS.

ayload Generator enerates a payload that use	Dynamic Pages custom, dynamic	yload 🔍 Classic Payload ; payload executable templates.
Payload Options	Stager	reverse_tcp
	Stage	windows/meterpreter
	LH0ST*	
	LPORT*	4444

4. Click the Stage dropdown and choose the stage you want the stager to download.

Payload Generato	r Oynamic Payload Classic Pauload Ises custom, dynamic payload executable te	yload ×
Payload Options	Stager reverse_tcp ▼ Stage windows/meterpreter	er v
	LHOST*	
	LPORT* 4444	(3)

The list will display applicable stages for the stager you have selected.

- 5. Enter the IP address that you want to the payload to connect back to in the LHOST field. (Reverse connections only)
- 6. Enter the port that you want the payload to connect back to in the LPORT field.
- 7. Enter the port that you want the listener to bind to in the RHOST field. (Bind connections only)

8. Click Generate.

If the payload generates without error, a window appears and alerts you that the payload has been generated and is ready for you to download. Click **Download Now** to automatically download the executable.

If your browser is not configured to automatically download files, a dialog window will appear and prompt you to save or run the file. You will need to save the executable to your computer.

Building Classic Payloads

A classic payload is built the traditional way--from scratch. The Payload Generator is particularly useful when you need to build a payload in various formats and encode them with different encoder modules. You can build a variety of payloads based on the operating system, architecture, type of connection, and output format that you need for a particular host.

Classic Payload Options

The following table describes the most common options that are available for classic payloads:

Option	Description
	Specifies the platform.
Platform	The following platforms are supported: AIX, Android, BSD, BSDi, Firefox, Java, Linux, Netware, NodeJS, OSX, PHP, Platform, Python, Ruby, Solaris, Unix, and Windows.
	Specifies the processor architecture.
	The Payload Generator shows you the options that are available for the architecture you have selected.
	The following architectures are supported:
Architecture	• AIX
	Android
	BSD sparc and x86
	• BSDi
	Firefox
	• Java

metasploit

Option	Description
	 Linux armle, cbea. cbea64, java, mipsbe, mipsle, ppc, ppc64, x86, and x86_64

	Solaris java, sparc, and x86
	Unix cmd, java, and tty
	 Windows cmd, java, x86, and x86_64
	Specifies the type of payload that the exploit will deliver to the target.
Payload	The Payload Generator shows you the payloads that are available for the platform you have selected.
	Specifies the type of stager that the payload will use to set up the network connection between the target machine and the payload handler running on the Metasploit server.
Stager	The stager enables you to use a smaller payload to load and inject a larger, more complex payload called the stage.
	The list of stagers that are available will vary based on the platform and architecture that you have selected.
	Specifies the function to call when a payload completes so that it can safely exit a thread.
	Choose one of the following exit functions:
Exit Function	Thread - Calls the ExitThread API function.
	Process - Calls the ExitProcess API function.
	• SEH - Restarts the thread when an error occurs.
	 None - Enables the thread to continue executing so that you can serially run multiple payloads together.
Listener Host	Defines the IP address that you want the target host to connect back to.
Listener Port	Defines the port that you want to use for reverse connections.
Added Shellcode	Enables you to specify an additional the shellcode file that will run in a

Option	Description
	separate, parallel thread while the main thread executes the payload.
Size of NOP Sled	Defines the length of the NOP sled you want to prepend to the payload.
	Each NOP you add to the payload adds 1 byte to the total payload size.

Note: The options that are available for a payload vary based on its architecture, platform. and payload type.

Generating PowerShell Payloads

PowerShell payloads provide you with the ability to execute PowerShell scripts on compromised systems. To generate a PowerShell payload, generate a classic payload and deselect the stager option.

At a minimum, the payload should use the following settings:

- Platform Windows
- Payload windows/bind_shell_tcp
- Output type Executable file
- Format psh, psh-net, psh-reflection, or psh-cmd

The generated payload for psh, psh-net, and psh-reflection formats have a .ps1 extension, and the generated payload for psh-cmd format has a .cmd extension.

Encoding the Payload

An encoder enables you to eliminate bad characters from a payload so that you can use it with a particular exploit. A character is considered to be bad if some aspect of the exploit makes it impossible to use. For example, many applications interpret a null byte as the end of a string. If it appears anywhere in the payload, the shellcode will terminate before it completes and cause the payload to fail. In this particular case, you can apply an encoder that removes null bytes from the payload.

An encoder does not guarantee that a payload will evade anti-virus detection, but it will ensure a payload does not contain bad characters that can cause issues with an exploit or produce unintended results.

The following are examples of common bad characters:

- Spaces
- Carriage returns
- Line feeds
- Tabs
- Null bytes

There are many different encoders that are available in the Metasploit Framework, which can be used for various situations. For example, some encoders, such as <code>alpha_mixed</code> and <code>alpha_lower</code>, can be used to replace characters with all alphanumeric characters, which can be useful for applications that only accept text-based characters as input. Other encoders, such as the very reliable and highly ranked <code>shikata_ga_nai</code>, are polymorphic XOR encoders that use an XOR encrypting scheme to help evade detection.

Encoding options are only available for the following platforms:

- AIX
- BSD sparc
- BSD x86
- BSDi
- Linux mipsbe
- Linux mipsle
- Linux ppc
- Linux x86
- Linux x86_64
- Netware
- OSX ppc
- OSX x86
- OSX x86_64
- PHP
- Platform sparc
- Platform x86
- Platform x86_64
- Python cmd
- Solaris sparc
- Solaris x86

- Unix cmd
- Windows cmd
- Windows x86
- Windows x86_64

Encoding Options

You can use the following options to encode a payload:

Option	Description
	Sets the encoder that is used to encode the payload.
Encoder	The Payload Generator only displays the encoders that are applicable
	to the platform and architecture you have selected.
	Specifies the number of times that you want to encode the payload.
Number of Iterations	The more times you encode a payload, the larger the payload becomes.
	You may need to modify the number of iterations if it causes the
	payload to exceed the maximum payload size.
	Defines the maximum size of the resulting payload in bytes.
	The maximum size takes precedence over the encoding iterations. If
Maximum Size of Dayland	the encoder causes the payload to exceed the maximum size you have
Maximum Size of Payload	specified, the Payload Generator will display an error message.
	To fix the error, you can select a new encoder, modify the number of
	iterations, or set a different maximum payload size.
	Specifies the list of characters that you do not want to appear in the
	payload, such as spaces, carriage returns, line feeds, tabs, and null
	bytes.
Bad Characters	You must enter the values in hex.
	You can copy and paste the hex characters into the text box. The text editor will attempt to format the hex

Output Options

You can use the following options to create the binary file:

Option	Description
	Specifies the output type for the payload.
Output type	Choose from the following types: executable, raw bytes, or shellcode buffer.
	Specifies the format to use to output the payload.
Format	Choose from the following formats: asp, aspx, aspx-exe, dll, elf, elf-so, exe, exe-only, exe-service, exe-small, hta-psh, loop-vbs, macho, msi, msi-nouac, osx-app, psh, psh-net, psh-reflection, psh-cmd, vba, vba-exe, vba-psh, vbs, and war.
Preserve original functionality of executable	Enables you to inject the payload into an existing executable and retain the original functionality of the original executable. The resulting executable will function like the original one.
	You should only enable this option only if you have uploaded a template file.
Template file	Specifies the executable template that you want to use to run in the main thread. For example, you can embed the payload in an executable, like calc.exe. When the executable runs, it creates a separate thread for the payload that runs in the background and continues to run calc.exe in the main thread.

Generating a Classic Payload

The configuration of a classic payload will vary based on the platform, architecture, payload, stager, and stage that you have selected. The following instructions will provide an overview of the steps that you need to perform to generate a classic payload--such as a Linux Meterpreter Reverse TCP payload.

1. From the Projects page, launch the Payload Generator.

2. Select the Classic Payload option.

3. Click the **Platform** dropdown button and choose one of the available platforms.

Payload Generato	or 🔍 Dynamic Pa	yload 💿 Classic Payload	×
Builds a customized payl	oad. (All platforms)		
Payload Options	Platform	Windows	
Encoding	Architecture	×86 •	
Output Options	🗹 Stager	reverse_tcp	
	Stage	windows/meterpreter	

For a list of supported platforms, see Classic Payload Options on page 149.

4. Click the Architecture dropdown button and select one of the available processor architecture types.

Payload Generato	or 🔍 Dynamic Pa	yload 💿 Classic Payload	×
Builds a customized payl	oad. (All platforms)		
Payload Options	Platform	Windows •	
✓ Encoding	Architecture	×86	
Output Options	🗹 Stager	reverse_tcp •	
	Stage	windows/meterpreter	

The list of architecture types will vary based on the platform that you have selected. Some platforms, such as Android and AIX, will not have a platform.

From this point on, the steps will vary depending on the platform, architecture, and payload you have selected. Generally, you will need to specify the LHOST (reverse), LPORT, and RHOST (bind) that the payload uses, as well as the output options for the executable. You can also do things like encode the payload.

For more information on payload options, see *Classic Payload Options* on page 149. For more information on output options, see *Output Options* on page 153. For more information on encoding options, see *Encoding Options* on page 153.

When you are ready to build the payload, click the **Generate** button. The **Generate** button will be active if all required options for the payload are configured.

ayload Options	Output type	Executable file Raw bytes	Shellcode buffer
Encoding	Format	exe 🔻	
Output Options	Template file	No file selected	Choose File
		Preserve original functionality of the	e executable

If the payload generates without error, a window appears and alerts you that the payload has been generated and is ready for you to download. Click **Download Now** to automatically start the download process.

If your browser is not configured to automatically download files, a dialog window will appear and prompt you to save or run the file. You will need to save the payload to your computer.

Listeners

A listener is the component that waits for an incoming connection from an exploited system. You must set up a listener if you intend to establish a connection between your Metasploit server and the exploited machine. For example, if you have delivered an executable to a target host, you will need to set up a listener to wait for a connection from it. When the host connects to the listener, a session opens on their machine, which will enable you to interact with it to do things like collect evidence from their system.

In Metasploit Pro, you can set up persistent listeners, which will continuously listen for connect backs from a compromised host. You can set up a persistent listener from the Global Settings area of the web interface. Each listener is bound to a specific project.

To set up a listener, you will need to define the listening host, listening port, and payload type. You can also assign a post-exploitation macro to the listener, so that when the exploited system makes a connects back to the listener, Metasploit Pro runs the macro.

Setting Up a Listener

- 1. Select Administration > Global Settings.
- 2. Find the Persistent Listeners section.
- 3. Click the New Listener button.
- 4. When the Create a Listener form appears, specify the following:
 - Associated project Choose the project you want to use to access and manage open sessions.
 - *Listener payload* Choose the appropriate payload for the listener.
 - Listener Address Specify the IP address that you want the payload to connect back to (e.g., the IP address of the Metasploit server).
 - Listener Port Specify the port you set up for the handler when you generated the Windows Meterpreter Reverse TCP payload (e.g., 4444).

5. Save the listener.

Credentials

These days, more and more organizations are becoming vulnerable to outside threats due to weak password policies and insecure password management systems. Credentials provide a gateway into various accounts and systems, which can potentially give access to additional targets on the network and lead to the extraction of confidential data from these targets. Therefore, as part of a penetration test, it is important to discover and present credential data that compels organizations to strengthen and enforce complex password policies to prevent vulnerabilities like password reuse and weak passwords.

As part of your credentials audit, you want to identify weak passwords, the most commonly used passwords, and top base passwords. You will also want to reuse valid credentials, so that you can identify the impact of the stolen credentials across a network. This will help an organization understand their current posture, identify how they can strengthen password policies, and enforce passwords requirements that meet industry best practices.

To help you understand how credentials are obtained, stored, and managed by Metasploit Pro, the following section will provide an overview of the key concepts and terms you must know before working with credentials.

Understanding Credential Terminology

Typically, when you think of a credential, you think of a username and password. In Metasploit Pro, a username is referred to as a public, and the password is known as a private; therefore, a credential can be a private, public, or a credential pair.

To summarize the key credential terms:

- Public: The username that is used to log in to a target.
- <u>Private</u>: The password that is used to authenticate to a target. It is usually a plaintext password, an SSH key, NTLM hash, or nonreplayable hash. Since the private can be an SSH key or hash, the term 'password' is not broad enough to cover these private types.
- Credential pair: A public and private combination that can be used to authenticate to a target.
- <u>Private type</u>: Refers to whether the private is a plaintext password, an SSH key, NTLM hash, or nonreplayable hash.
- Nonreplayable hash: A hash that cannot be replayed to authenticate to services. For example, any hash that was looted from /etc/passwd or /etc/shadow is a nonreplayable hash.
- NTLM hash: A hash that can be replayed to authenticate to SMB.

- <u>Realm</u>: Refers to the functional grouping of database schemas to which the credential belongs. A realm type can be an Active Domain Directory, a Postgres database, a DB2 database, or an Oracle System Identifier (SID). A public, private, or credential pair can have a realm, but it is not mandatory.
- Incomplete public: A public that does not have a private. It can have a realm, but it is not required.
- Incomplete private: A private that does not have a public. It can have a realm, but it is not required.
- Login: A username and private combination that is associated with a particular service. A login indicates that you can theoretically authenticate to a service using the credential pair. Metasploit Pro creates logins when it collects evidence from an exploited target and when it successfully bruteforces a target.

During exploitation, if a host is successfully looted, Metasploit Pro will attempt to create logins based on the type of credential that was captured. For example, if NTLM hashes were looted, then a login for SMB will be added for each hash. For example, a credential pair, such as admin/admin, that can be used to authenticate to a service, like telnet, is a login.

- <u>Origin</u>: Identifies how the credential was obtained or added to the project, such as through Bruteforce, manual entry, or an imported credentials list. A origin can be manual, import, session, service, or cracked password.
- Validated credential: A credential that has successfully authenticated to a target.

Obtaining Credentials

There are a few ways that you can obtain credentials. The main methods of acquiring credentials include exploiting a vulnerability and dumping the credentials from the compromised target; bruteforcing targets using weak and common default credentials; and searching publicly available resources for stolen credentials. The method you use depends on the level of access that you have to a target.

Metasploit enables you to leverage multiple attack methods to acquire credentials, such as exploiting unpatched vulnerabilities. For example, if you are able to discover a Windows system that is vulnerable to MS08-067, you may be able to exploit that target and log in to the system to gather information from it. With access to the system, you can extract data such as password hashes, plaintext passwords, and domain tokens.

Many information systems are configured to use passwords as the first, and sometimes only, line of defense. And oftentimes, the passwords are easy to guess passwords or even blank passwords. This means that if you have the username, you can try to guess the password to log in to the target. For example, a Windows domain account that uses a weak or blank password can be easily guessed via bruteforce.

Additionally, many systems are configured with the default account settings. These accounts usually share the same password across multiple instances, which means that if you know the default account settings for one account, you will be able to leverage those credentials to compromise other targets across

the network as well. In this case, you can manually add common default credentials and use the Quick Validation feature to validate the account credentials. If any credentials successfully authenticate to a target, you can run Credential Reuse to find additional targets on which the credentials are valid.

To summarize the methods that you can use to obtain credentials with Metasploit:

- You can find vulnerabilities and exploit them to obtain access to the target. Once you have access to a target, you can dump credentials and other confidential data from the exploited target.
- You can run Bruteforce to guess commonly used, weak, and default credentials on services like AFP, DB2, FTP, HTTP, HTTPS, MSSQL, MySQL, POP3, PostgreSQL, SMB, SNMP, SSH, telnet, VNC, and WinRM.
- You can manually add or import credentials to a project and run Quick Validation or Credential Reuse to find targets that can be authenticated. This method is useful when you have a set of commonly used credentials or known credentials you want to try on a set of targets.

Credential Origins

Every credential added to a project has an origin, which refers to the source of the credential. An origin can be one of the following:

- Manual: Indicates that you manually added the credential from the Manage Credentials page.
- Import: Indicates that you imported the credential by uploading a CSV file or PWDump to the project.
- Service: Indicates that the credential was obtained using Bruteforce.
- Session: Indicates that the credential was collected from a session on an exploited target.
- <u>Cracked password</u>: Indicates that Metasploit was able to crack the hash during evidence collection and decipher the plaintext password.

Managing Credentials

During a credentials audit, you will be collecting sensitive data from your targets and managing it from the Manage Credentials page. The Manage Credentials page displays all the credentials that are available in a particular project and provides access to features that let you add, delete, and export credential data. The following sections will show you how you can manage credential data within a project.

Adding Credentials

To add credentials to a project, you can either manually input each credential individually or you can import a PWDump or CSV file. The following sections show you how to manually add a plaintext password, SSH key, NTLM hash, and nonreplayable hash.

Manually Entering a Password

You can manually add a password when you have a single plaintext password that you want to add to a project, such as a common default like admin/admin. If you have multiple credentials that you want to add, you should create a CSV file for them and import them into the project. Importing credentials, in that particular case, will be much more efficient.

To manually add a password to a project:

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. When the Manage Credentials page appears, click the Add button.

Home $>$ LoadTesting $>$ C	Credential Management

10. Click OK.

The SSH key is added to the project and is viewable from the Manage Credentials page.

Importing and Exporting Credentials

You can import and export credentials to easily share them between projects or with other members of the organization. It is vital that this confidential information be shared responsibly, as it may contain plaintext credentials and extremely sensitive data.

Credentials can be imported in a couple of ways. You can import them as part of a workspace ZIP, which will automatically include all credentials contained in the export, as well as any other data that was part of the project. Workspace ZIP files can be imported from the Hosts or Overview page. If you only want to import credentials, you will need to do so from the Manage Credentials page. You can import credentials that have been exported from a project or you can import a credentials list that you have manually created.

When you export credentials from a project, Metasploit Pro creates a manifest file that contains the credential data and compresses it into a ZIP file. The manifest file is a CSV file that lists every credential

in the project and includes the following information for each credential: username, private type, private, realm type, realm name, host address, service port, service, and service protocol. If the project contains SSH keys, they will be included in the exported file. Each SSH key will be mapped to its corresponding username in the manifest file.

To help you understand how you can share credentials, the following sections walk you through importing and exporting credentials.

Importing Credentials Exported from Other Projects

When you export credentials from a project, Metasploit Pro creates a manifest file, which is a CSV file that contains all of the project's credential data, and compresses it into a ZIP file. You must import the ZIP file, not the CSV file.

If you want to import credentials that have been exported from another project, you must import the workspace ZIP file. This ensures that the file contains the required header row that Metasploit Pro needs to properly import the credentials and any additional data, such as SSH keys, that are associated with the manifest file. You cannot simply import the manifest.csv file; the import will fail if you attempt to import a manifest file that was created by Metasploit Pro.

To import exported credentials:

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. Click the Add button.

Home	LoadTesting	Credential Management

		1.C. 1.
Select the type that will your import file:	I be used for credentials that do not have Plaintext Password (ve a type defined in

7. Click the **Password Type** dropdown and select the type you want to assign to credentials that do not have a type defined in your import file.

Any credential that has a private must have a type defined for it. This option lets you set the default type for any credential that has an empty type field in the import file.

8. Enter tags for the credential pair. (Optional)

To enter a tag, start typing the name of the tag you want to use in the **Tag** field. As you type in the search box, Metasploit Pro automatically predicts the tags that may be similar to the ones you are searching for. If the tag does not exist, Metasploit Pro creates it.

9. Click OK.

The CSV is imported into the project. You can go to the Manage Credentials page to view the imported credentials.

Importing a Manually Created Credentials File

If you have a credentials list that you manually created, you can import it from the Manage Credentials page. The credentials file that you upload must be a CSV file that contains the following header row: username, private_data.

To import a manually created credentials file:

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. Click the Add button.

The Add Credentials window appears.

3. Select the Import option.

				O Manual
No file selected				Choose
Format	CSV	O pwdump	?	
your import file:

	-1.1.4	h De service ad	•		
	Plaintex	t Password	- ?		
Tags	Plaintex	LC Password	- ?	?	
Tags	Plaintex	c Password	• (?)	?	

7. Enter tags for the credential pair. (Optional)

To enter a tag, start typing the name of the tag you want to use in the **Tag** field. As you type in the search box, Metasploit Pro automatically predicts the tags that may be similar to the ones you are searching for. If the tag does not exist, Metasploit Pro creates it.

8. Click OK.

The CSV is imported into the project. You can go to the Manage Credentials page to view the imported credentials.

Importing a PWDump

A PWDump is a text file that contains credentials that have logins associated with them. The PWDump that you upload must be one that was exported from Metasploit Pro. Other types of password dumps are not supported.

To import a PWDump:

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. Click the Add button.

ne $>$ LoadTesting $>$	Credential Management							
lanage Cree	dentials 💿				Filter 📘	Search		
0 of 20 selected Export De	lete + Add							Tag 💽

your import file:	Plaint	credentials that do n ext Password	ot have a typ	e defined in
your import file:	Plaint	credentials that do n ext Password	t have a typ	e defined in

- 5. Select the file and click **Open**.
- 6. Select the **pwdump** format option.

						O Manual	Impo
pa	assword-list.txt			/		Choose	?
	Format	⊖ csv	• pwo	dump	?		
	Tags					?	

7. Enter tags for the credential pair. (Optional)

To enter a tag, start typing the name of the tag you want to use in the **Tag** field. As you type in the search box, Metasploit Pro automatically predicts the tags that may be similar to the ones you are searching for. If the tag does not exist, Metasploit Pro creates it.

8. Click OK.

The PWDump is imported into the project. You can go to the Manage Credentials page to view the imported credentials.

Exporting All Credentials

There are a couple of ways that you can export all credential data from a project. You can do it at the project level by exporting a workspace ZIP, will contain all of the information stored in the project, such as

host data, collected evidence, and reports, as well as a credentials folder that contains the credential data.

If you only want to export credential data from the project, you can export them from the Manage Credentials page. When you export credential data, Metasploit Pro creates the manifest file and automatically compresses it into a ZIP file for you, which enables you to import the file with no additional changes.

To export all credentials:

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. Click the Export button.
- 3. Enter a name for the file in the **File Name** field if you want to provide a custom name. Otherwise, you can use the auto-generated file name.

Export			2
Fi	le Name	credentials-1	407333383029
	Format	CSV	 pwdump (logins only)
	Rows	Selected	 All
		Cancel	ок

4. For the Format option, select CSV.

Export		×
File Name	credentials-1	407333383029
		O pwdump (logins
Format	CSV	only)
Rows	Selected	All
	Cancel	ок

5. For the Row option, select All.

Export

			O pwdump (logins	
	Format	CSV	only)	
	Rows	Selected		

6. Click **OK** to begin the export.

The export will automatically begin. Your system may prompt you to save the file if it is not configured for automatic downloads.

Exporting Selected Credentials

You can export specific credentials from a project from the Manage Credentials page.

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. Select the credentials that you want to export.

4. Click OK to begin the export.

The export will automatically begin. Your system may prompt you to save the file if it is not configured for automatic downloads.

Creating a Credentials CSV File to Import

You can create CSV files to import credentials into a project. For example, if you have a word list or password list that you want to add to a project, you will need to create a CSV file for those credentials. You can use a spreadsheet program, like Microsoft Excel or Google Docs, to create a CSV file.

The CSV file must include the header row username, private_data, which defines the fields in the table. The following image shows an example of a credentials list that was created in Microsoft Excel:

	А	В
1	username	private_data
2	administrator	administrator
3	guest	guest
4	username	password
5	admin	admin
6	root	
7		password
As you can see, the first row contains the required header row. The subsequent rows contain the data specified by each header. If you want to leave the username or private blank, you can leave the field empty.

When you are done creating the file, you will need to save with a .csv file extension so that you can import it into a project. For information on how to import a CSV file into a project, see*Importing and Exporting Credentials* on page 169.

Cloning and Editing Credentials

Cloning is a useful feature if you want to make a copy of a credential with some minor changes. For example, if you have a credential pair, such as admin:admin, you might want to add a variation, like admin1:admin1. The fastest way to do this would be to clone the original credential pair and tweak the public and private data for it.

Note: A credential cannot be modified after you save it to a project. The only way to edit a credential is to clone and modify it. If there are changes that you need to make to a credential, you will need to clone the credential, edit the clone, save the clone, an delete the original credential.

To clone a credential:

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. When the Manage Credentials page appears, find the row that contains the credential you want to clone.
- 3. Click the Clone button.

Ma	inag	e Credentia	als (9)					Filter Search			
0	of 9 seler Expor	ted Delete	+ Add							Tag 🛨	
		LOGINS	PUBLIC (USERNAME)	PRIVATE	TYPE	REALM	ORIGIN	VALIDATION	TAGS	CLONE	/
		0	admin	admin	Password		Manual	Not Validated	0 tags		
		0	administrator	e2fc15074bf7751dd408e6 more	NTLM hash		Import	Not Validated	0 tags		

A duplicate of the credential is created and added to the table. Any data that you can modify is displayed in an editable field.

lanag	ge Cred	lentials (9)					Filter Search		
0 of 9 sele Expo	lected ort Del	ete + Add							Tag 🛨
	LOGINS	PUBLIC (USERNAME)	PRIVATE	TYPE	REALM	ORIGIN	VALIDATION	TAGS	CLONE
	0	admin	admin	Realm Type	Manual	Not Validated	Plaintext Password 💲	Save Cancel	

- 4. Edit any of the following fields: public (username), private (password), realm, origin, or password type. You must modify one of the fields because a project cannot contain duplicates of the exact credential entry. You will not be able to save the credential unless the credential is unique. For example, you can have an two entries for admin/admin as long as either the realm or private type is different.
- 5. Click Save when you are done.

The credential is added to the project and viewable from the Manage Credentials page.

Deleting Credentials

If there are credentials that you no longer need to store in a project, you can delete them. All deleted credentials are permanently removed from the project and cannot be recovered.

- 1. From within a project, go to Credentials > Manage to access the Manage Credentials area.
- 2. When the Manage Credentials page appears, select the credentials you want to delete.

Export Del	ete + Add							Tag 🚺

LOGINS	PUBLIC (USERNAME)	PRIVATE	TYPE	REALM	ORIGIN	VALIDATION	TAGS	CLONE
Ø 0	admin	password	Password		Manual	Not Validated	0 tags	••

When the confirmation window appears, click **OK** to delete the credentials from the workspace. The credential, including all of its logins, will be removed from the project. You must be absolutely sure that you want to delete the credential. You will not be able to restore deleted credentials.

Reusing Credentials

With exceedingly more and more stringent password requirements, credential reuse is becoming a common issue within many organizations. Users inundated with complex password policies may resort to reusing the same password across multiple accounts so that they can easily manage their credentials. This can cause major security issues when those credentials are compromised. For example, if an attacker is able to obtain valid credentials on one target, they can try those credentials on other targets to further compromise the network.

To help an organization audit their passwords, you can reuse credentials to identify additional targets that will be vulnerable if a particular credential is compromised. Credentials Reuse is a Metasploit Pro feature reuses validated credentials to attempt to authenticate to additional targets. This feature is useful when you have validated or known credentials that you want to try on a set of targets. For example, if you were able to obtain an NTLM hash on a target, you should try to reuse that hash on other SMB targets. If a system administrator commonly deploys the default configuration for a system, the likelihood that the credential will work is high.

Credentials Reuse Workflow

Credentials Reuse provides guided workflow for the required tasks that need to be configured. Each task in the workflow is displayed on its own tab. You can click on any of the tabs to switch between the different tasks in the workflow; however, you must complete each task before you can move to the next.

now [20 T 1 - 8 of 8									

metasploit

The workflow is quite simple and comprises of four steps:

- 1. Select the targets that you want to try the credentials on.
- 2. Select the credentials that you want to use to authenticate to the selected targets.
- 3. Configure the reuse settings, such as the timeout and validation limits, and review the target that you want to use.
- 4. Launch the task.

Credentials Reuse Targets

Credentials Reuse utilizes several login scanners from the Metasploit Framework, which enable Credentials Reuse to target the following services: AFP, DB2, FTP, HTTP, HTTPS, MSSQL, MySQL, POP3, PostgreSQL, SMB, SNMP, SSH, telnet, VNC, and WinRM.

Targets that do not have a login scanner, such as DCERPC, will be skipped.

Configuring and Running Credentials Reuse

1. From within a project, select **Credentials > Reuse**.

The Credentials Reuse workflow appears. The Targets tab displays first and shows you the targets that are available in the project. Targets, in this instance, are services. Metasploit Pro pulls this data from the host and service data that is stored in the project.

- 6. If you want to control the timeout settings for Credentials Reuse, you can configure any of the following options:
 - <u>Service Timeout</u> Sets the timeout, in seconds, for each target.
 - <u>Overall Timeout</u> Sets the timeout for the entire Credentials Reuse task.
 - <u>Validate one credential per service</u> Limits the number of credentials that are validated for a service on a host to one. Once a credential has been validated for a service, Credentials Reuse will stop testing with other credentials.
- 7. Review the targets and credentials that you have selected for Credentials Reuse.

If there are any that you want to remove, you can click on the **Remove 'X'** button located next to the target or credential or you can click on the **Remove 'X'** button located at the top of each list to remove all targets or credentials.

The Findings window shows you the following statistics:

- Login attempts The total number of login attempts that were made. Credentials Reuse will only attempt logins for the following services: AFP, DB2, FTP, HTTP, HTTPS, MSSQL, MySQL, POP3, PostgreSQL, SMB, SNMP, SSH, telnet, VNC, and WinRM. Therefore, the Login Attempts may not include all of the targets that you have selected. The Login Attempts also shows you results for the login and when the login was last attempted.
- <u>Validated credentials</u> The total number of credentials that successfully authenticated.
- <u>Validated targets</u> The total number of targets that were validated.

 <u>Successful logins</u> - The total number of logins that were successful. This number is derived from the number of validated credentials and validated targets.

If Metasploit is able to identify a realm for a credential, it will add the realm information to the credential. You can view the updated credential from the Manage Credentials page.

Searching for Credentials

You can create advanced search queries to find exact credential matches on the Credential Management, Bruteforce, and Credentials Reuse pages. This capability can help you narrow the search results down to a subset of data, such as a specific public and private.

Creating a Search Query

To search for credentials, click on the **Search** field located on the Credential Management, Bruteforce, or Credentials Reuse page. A dropdown displays and shows you the search operators that are available. You will need to select a search operator from the list to continue. The search field displays the possible keywords that are available for the selected operator. You can choose a keyword from the list or you can start typing to refine the list.

nag	ge Crede	entials (8)			C.USERNAME:	administrator			(

	0	support_388945a0	aad3b435b51404eeaad3b4 more	NTLM hash		Import	Not Validated	0 tags	
	0	support_388945a0	aad3b435b51404eeaad3b4 more	NTLM hash		Import	Not Validated	0 tags	

To create a search query for credentials, you need to specify at least one search operator and keyword. A search operator indicates the type of data you want to query and a keyword refers to the term that the search uses to find matching records. You can use as many search operators as you need. As you add search operators to the query, the table automatically updates the credentials that are listed.

By default, the search query uses the AND connector between each search operator. For example, the query "PUBLIC.USERNAME: John, PRIVATE.DATA: abc123" returns any username that contains "John" that has a password of "abc123". However, if a query contains multiple operators of the same type, the query uses the OR connector between those operators instead. For example, the query "PUBLIC.USERNAME: John, PUBLIC.USERNAME: Mike, PRIVATE.DATA: abc123" returns any username that contains "John" or "Mike" that has a password of "abc123".

I The search query automatically adds an AND connector between each search operator. However, if the search query uses more than one search operator of the same type, the query uses the OR connector between those operators instead.

Search Operators

The following search operators are available for credentials:

- <u>public.username</u>: This search operator matches a username.
- private.data: This search operator matches a private.
- private.type: This search operator matches a private type.
- realm.key: This search operator matches a realm type.
- realm.value: This search operator matches a realm name.
- tags.name: This search operator matches a a tag.

Credential Search Syntax

You must use the following syntax when searching for credentials: <search operator>:<keyword>. For example, if you want to find all publics that have a value of 'admin', you need to create the following query: public.username:admin. This query ensures that the search only looks in the 'Public' column in the credentials table for the 'administrator' keyword and only returns credentials that have 'administrator' as its public value.

Searching for a Public

To search for a public, your query must use 'public.username' operator. For example, the query public.username:admin searches for any credential that has a public of 'admin'.

Searching for a Private

To search for a private, your query must use the 'private.data' operator. For example, the private.data:abc123 query searches for any credential that has a private of 'abc123'.

Searching for a Private Type

To search for a private type, your query must use the 'private.type' operator. For example, the private.type:hash query searches for any credential that has a private type of 'hash'.

Searching for a Realm Type

To search for a realm type, your query must use the 'realm.key' operator. For example, the realm.key:DB2 Database query searches for any credential that has a realm type of 'DB2 Database'.

Searching for a Realm Name

To search for a realm, your query must use the 'realm.value' operator. For example, the realm.value:DC query searches for any credential that has a realm name of 'DC'.

Searching for Credentials with a Specific Tag

To search for a credential with a specific tag, your query must use the 'tags.name' operator. For example, the tags.name:window query searches for any credential that has the 'windows' tag.

Filtering by Credential Metadata

The single credential page shows you details for a particular credential, such as its metadata and related logins. To access the single credential page, click on the private link on the Manage Credentials page, as shown below:

aų	je crede					<u> </u>			
f8 sel Exp	ected art Delete	e + Add							Tag 💽
	LOGINS	PUBLIC	PRIVATE	TYPE	REALM	ORIGIN	VALIDATION	TAGS	CLONE
	0	administrator	e2fc15074bf7751dd408e6 more	NTLM hash		Import	Not Validated	0 tags	
	0	cyg_server	e2fc15074bf7751dd408e6 more	NTLM hash		Import	Not Validated	0 tags	
	0	guest	aad3b435b51404eeaad3b4 more	NTLM hash		Import	Not Validated	0 tags	
	0	guest		Password		Import	Not Validated	0 tags	
	0	sshd	aad3b435b51404eeaad3b4 more	NTLM hash		Import	Not Validated	0 tags	
	0	sshd		Password		Import	Not Validated	0 tags	
	0	support_388945a0	aad3b435b51404eeaad3b4 more	NTLM hash		Import	Not Validated	0 tags	
	0	support_388945a0	aad3b435b51404eeaad3b4 more	NTLM hash		Import	Not Validated	0 tags	

When you click on the private, the single credential page slides into view. Note that the public, private, and private type values display as links. You can click on these links to query other credentials in the project that share the same public, private, or private type.

				Тад
HOST ACCESS	S LEVEL TAG	IS LAST ATTEMPTED	VALIDATION	VALIDATE
	HOST ACCES	HOST ACCESS LEVEL TAC	HOST ACCESS LEVEL TAGS LAST ATTEMPTED No Items were found.	HOST ACCESS LEVEL TAGS LAST ATTEMPTED WALIDATION

The Manage Credentials page appears and shows the results of the query. The filters will be preselected based on the type of data you queried. For example, if you are viewing the data for a public, such as administrator, you may want to see other credentials in the project that share the same public. To do this, you can simply click on the public. When the Manage Credentials page appears, you can choose additional filters to further narrow down the credentials list.

Bruteforce Attacks

A bruteforce attack automatically and systematically attempts to guess the correct username and private combination for a service. Its goal is to find valid logins and leverage them to gain access to a network to extract sensitive data, such as password hashes and tokens. As part of a penetration test, it is important that you assess the effectiveness of a bruteforce attack against a network so that you can identify audit password policies and identify potential attack vectors. This knowledge enables you to create a refined list of technical recommendations and provide real business risk analysis. To help you perform a bruteforce attack, you can use the Bruteforce Workflow, which provides a guided interface that helps you configure an automated password attack against a set of targets.

Accessing the Bruteforce Workflow

To access the Bruteforce Workflow, select **Credentials > Bruteforce** from the project tab bar, as shown below.

™ motocoloit°	Project - d	efault 🔻							Acco	unt - tdoan 🔻	Administration v	?	20
		Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Credentials	Reports	Exports	Tasks		
								Manage					
Home default	verview							Reuse					
Overview - Project def	ault							Bruteforce					
								\sim					

Defining Hosts for a Bruteforce Attack

The first thing you need to do in the Bruteforce Workflow is define the scope for the attack. The scope determines the hosts in the project that you want to target during the attack. You can choose to attack all hosts in the project or you can manually define them if you want granular control over the scope of the attack.

To attack all hosts in a project, select the All hosts option from the Targets section, as shown below.

vant to bruteforce and the credentials you want to use to	attempt authentication.	
TARGETS	CREDENTIALS	OPTIONS
0 targets selected Select Host(s): © All hosts © Enter target addresses Select Services: © AIP MSSQL SNMP © B2 My SQL SNMP © B2 My SQL SSH © TTP © POP3 Telnet © HTTPS SMB WinRM	 O posuble combinations All credentials in this project Attempt factory default Add/Import credential pairs 	Overall Timeout HH Mut SS (Hours Minutes Seconds Service Timeout SS (Seconds (Time Between Attempts Mennal @ seconds) • (Apply mutation(s) (Stop bruteforcing a target when a credential is guessed Get sessions if possible (

To attack specific hosts in a project, select the **Enter target addresses** option from the **Targets** section, as shown below. You can enter a single address (192.168.1.1), a range (192.168.1.1-192.168.1.100), a CIDR notation (192.168.1.0/24), or a wildcard (192.168.1.*). You must use a newline to separate each entry. If you want to include all hosts in the project, you can leave this field empty.

want to bruteforce and the credentials you want to use b	inticate to services on target hosts. Select the hosts and servi o attempt authentication.	ices	
TARGETS	CREDENTIALS	OPTIONS	
0 targets selected Select Host(s):	0 possible combinations All credentials in this project	Overall Timeout HH Hours Minutes	SS Seconds
 All hosts Enter target addresses 	Add/Import credential pairs	Service Timeout SS Seconds	
Target addresses: 🧿		Time Between Attempts Normal (0 seconds)	T
Excluded addresses:		Apply mutation(s)	
		Stop bruteforcing a target when a constraint guessed	redential is
		Get sessions if possible	
All Services			
DB2 MySQL SSH			
FTP POP3 Telnet			
FILLP POSTERS VINC			

Excluding Hosts from a Bruteforce Attack

An exclusion list defines the hosts that you do not want to attack. An exclusion list is particularly useful if you want to define a range for the target hosts and want to exclude a few hosts from the range. For example, if you have defined 192.168.0.0/24 as the target address range, but you know that you cannot test 192.168.0.1 and 198.168.0.2 due to lockout risks, you can add them to the exclusion list.

To exclude hosts from a bruteforce attack, select the **Enter target addresses** option from the Targets section. Enter the hosts you want to blacklist in the **Excluded addresses** field, as shown below.

want to bruteforce and the credentials you want to u	use to attempt authentication.	v Kees
TARGETS	CREDENTIALS	OPTIONS
0 targets selected Select Host(s):	0 possible combinations All credentials in this project Attempt factory defaults	Overall Timeout [HH] [MM] [SS Hours Minutes Second
 Enter target addresses 	Add/Import credential pairs	Service Timeout SS Seconds
Target addresses:		Time Between Mommit (0 seconds) Attempts Attempts Apply mutation(s) Stop bruteforcing a target when a credential guessed
Select Services: All Services AFP MSSQL SNMP DB2 MySQL SSH TTP 003 Tellet HTTP Potgres VNC HTTPS SMB WmRM		Get sessions if possible

You can enter a single IP address, an address range, or a CIDR notation. If there are multiple addresses or address ranges, use a newline to separate each entry.

You can leave the **Target addresses** field empty to include all hosts in the project, except for the ones listed in the **Excluded addresses** field.

Selecting Services for a Bruteforce Attack

After you select the hosts that you want to attack, you need to choose the service logins you want to bruteforce. The services that bruteforce targets are limited to the following: AFP, DB2, FTP, HTTP, HTTPS, MSSQL, MySQL, POP3, PostgreSQL, SMB, SNMP, SSH, Telnet, VNC, and WinRM. You can choose to target all services, or you can choose any combination of them. A login attempt only occurs if the service is open on the host. Otherwise, it is skipped.

Bruteforce Bruteforce systematically attempts to use credentials to authenticate to services on target hosts. Select the hosts and services you want to bruteforce and the credentials you want to use to attempt authentication. TARGETS CREDENTIALS OPTIONS 0 targets selected 0 possible combin HH MM SS ? Overall Timeout Select Host(s): All credentials in this project Attempt factory defaults All hosts SS Add/Import credential pairs ? Enter target addresses Normal (0 seconds) Select Services: All Services MSSQL SNMP AFP MySQL Apply mutation(s) ? DB2 SSH FTP POP3 🔲 Telnet Stop bruteforcing a target when a credential is guessed HTTP Postgres VNC HTTPS SMB WinRM Get sessions if possible ?

To specify the services for a bruteforce attack, select them from the **Services** list, as shown below:

After you select services for the bruteforce attack, the total targets count is updated under the Targets section. The total number of targets that are selected is calculated based on the number of hosts and services you have selected.

Building a Password List for a Bruteforce Attack

A bruteforce attack uses a password list, which contains the credentials that can be used to bruteforce service logins. You can obtain password lists online that contain commonly used credentials, such as admin/admin, or you can custom build password list using the data you have gathered about the target. For example, if you were able to obtain and crack NTLM hashes from a target, you should add them to the password list so that the bruteforce attack can try them against additional targets.

With the Bruteforce Workflow, you can use any combination of the following methods to build a password list for the bruteforce attack:

- You can choose all credentials stored in the project.
- You can try common account default settings.
- You can import a password list.
- You can manually enter a password list.

Bruteforce tries each credential pair in the password list to attempt to authenticate to a service. If it is able to authenticate to a service with a particular credential, the credential is saved to the project and a login for the service is created. Bruteforce continues to iterate through the password list until all credentials have been tried or until it reaches a limit that you have defined.

The total number of credentials that are selected is calculated based on the Cartesian product of the credentials you have selected and the number of mutations you have applied.

Using All Credentials in a Project for a Bruteforce Attack

To configure a bruteforce attack to use all the credentials in a project, select the **All credentials in this project** option from the Credentials section of the Bruteforce Workflow, as shown below.

want to bruteforce and the credentials you want to use t	to attempt authentication.		
TARGETS	CREDENTIALS	OPTIONS	
0 targets selected Select Host(s):	778 possible combinations All credentials in this project At any effectory defaults	Overall Timeout [HH] Hours Minutes Seconds	(
 All hosts Enter target addresses 	Add/Import credential pairs	Service Timeout SS Seconds	(
Select Services:		Time Between Attempts Normal (0 seconds)	(
AFP MSSQL SNMP DB2 MySQL SSH FTP POP3 Telnet		Apply mutation(s)	(
HTTP Postgres VNC HTTPS SMB WmRM		guessed	
		Get sessions if possible	(

Manually Entering Credentials for a Bruteforce Attack

You can manually create the password list for a bruteforce attack. To manually add credential pairs for the bruteforce attack to use, select the **Add/Import** credential pairs option from the Credentials section. The **Manually Add Credentials** text box appears, as shown below.

ruteforce systematically attempts to use credentials to authent o bruteforce and the credentials you want to use to attempt auth	icate to services on target hosts. Select the hosts and services you want sentication.

Hours Minutes Seconds ? Seconds Time Between Normal (0 seconds) • ? Artempts ? ? Supply mutation(s) ? ? updested Destand ? Both Seconds ? ?

You can provide a space and newline delimited list of credential pairs. The first word on each line is treated as the username. Each word that follows the username is the password. You can enter up to 100 credential pairs in the text box. If you need to add more than 100 credential pairs, you will need to create a credentials file and import the file. For more information on importing a credentials file, see*Importing a Password List for a Bruteforce Attack* on page 198.

You must follow these syntax rules when you manually enter a password list:

- To define a credential pair, use the following format: username password.
- To specify multiple passwords for a username, enter the username followed by the passwords. Each password must be separated by a space.
- · Each credential entry must be on a newline.
- Each item must be space delimited.
- To specify a blank username, use <BLANK> for the username.
- To specify a username with a blank password, enter the username only.

Password List Example

username <BLANK> pass username pass username pass1 pass2

Importing a Password List for a Bruteforce Attack

A password list is a text file that contains credential pairs. You can manually create a password list using a basic text editor, like Notepad, or you can download a password list online.

The password list must follow these rules:

- Each credential pair must use the following format: username password.
- Each credential pair must be on a newline.
- Each item must be space delimited.
- A blank username must be defined as <BLANK>.
- A blank password does not have to be
- A username with no password indicates a blank password.

To import a password list, select the **Add/Import** credential pairs option from the Credentials section. Click the **Choose File** button, as shown below.

uteforce systematically attempts to use credentials to authenti bruteforce and the credentials you want to use to attempt auth	cate to services on target hosts. Select the hosts and services you want entication.

Using Factory Defaults for a Bruteforce Attack

Default credentials are username and password pairs that are shipped with an operating system, database, or software. Oftentimes, these factory defaults are the same for all versions of a software, are publicly documented, and oftentimes left unchanged. Therefore, as a best practice, vendors always recommend that the default password be changed before the system is deployed to a production environment. However, this security practice is not always followed, and systems are often deployed with the default configuration settings, which make them prime targets for bruteforce attacks.

To help you identify systems that use the default configuration, Bruteforce includes an option called **Attempt factory defaults**, which enables you to bruteforce services using common default credentials. The following section lists the credentials that will be tried for each service if you have this option enabled.

TARGETS	CREDENTIALS	OPTIONS
O targets selected Select Host(s):	 1.150 combinations All credentials in this project ✓ Attempt factory defaults Add Import credential pairs 	Overall Timeout HH MM SS Hour Minute Seconds Service Timeout SS Time Between Normal (0 seconds) • Apply mutation(s) Stop bruteforcing a target when a credential is guessed Get sessions if possible

Default Credentials for Axis2

The following usernames and passwords are common defaults for Axis2:

- Usernames 'admin'
- · Passwords 'axis2'

Default Credentials for DB2

The following usernames and passwords are common defaults for DB2:

- Usernames 'admin', 'dasusr1', 'db2admin', 'db2fenc1', and 'db2inst1'
- Passwords 'admin', 'dasusr1', 'db2admin', 'db2fenc1', 'db2inst1', 'db2pass', 'db2password', and 'db2pw'

Default Credentials for FTP

The following usernames and passwords are common defaults for FTP:

- Usernames 'admin', 'anonymous', 'ftp', 'ftp_admi', 'ftp_inst', 'ftp_nmc', 'ftp_oper', 'ftpuser', 'login', 'rapport', 'root', 'user', and 'xbox'
- Passwords '1234', 'access', 'chrome@example.com', 'Exabyte', 'ftp', 'help1954', 'IEUser@', 'kilo1987', 'mozilla@example.com', 'pass', 'password', 'pbxk1064', 'r@p8p0r', 'tuxalize', and 'xbox'

Default Credentials for HTTP

The following usernames and passwords are common defaults for HTTP:

- Usernames 'admin', 'apc', 'axis2', 'cisco', 'connect', 'manager', 'newuser', 'pass', 'private', 'root', 'security', 'sitecom', 'sys', 'system', 'tomcat', 'user', 'wampp', 'xampp', and 'xampp-dav-unsecure'
- Passwords '1234', 'admin', 'apc', 'cisco', 'connect', 'default', 'letmein', 'manager', 'none', 'pass', 'password', 'ppmax2011', 'root', 'sanfran', 'security', 'sitecom', 'sys', 'system', 'tomcat', 'turnkey', 'user', 'wampp', and 'xampp'

Default Credentials for MSSQL

The following usernames and passwords are common defaults for MSSQL:

- Usernames 'Administrator', 'ARAdmin', 'entIdbdbo', 'entIdbreader', 'mon_user', 'probe', 'repl_ publisher', 'repl_subscriber', 'sa', and 'WinCCConnect'
- Passwords '2WSXcder', 'AR#Admin#', 'blank', 'dbopswd', 'pass', 'pass1', 'password', 'rdrpswd'

Default Credentials for MySQL

The following usernames and passwords are common defaults for MySQL:

- Usernames 'admin', 'mysql', and 'root'
- Passwords 'blank', 'pass', 'pass1', 'password', and 'vicidia1now'

Default Credentials for PostgreSQL

The following usernames and passwords are common defaults for PostgreSQL:

- Usernames 'admin', 'postgres', 'scott', and 'tom'
- Passwords 'admin', 'password', 'postgres', and 'tiger'

Default Credentials for SMB

The following usernames and passwords are common defaults for SMB:

- Usernames 'backup' and 'helpdesk'
- Passwords 'backup' and 'hpinvent'

Default Credentials for SNMP

The following usernames and passwords are common defaults for SNMP:

- Usernames <BLANK>
- Passwords '0392a0', '1234', '2read', '4changes', 'access'. 'adm', 'Admin', 'admin', 'agent', 'agent_ steal', 'all private', 'all public', 'ANYCOM', 'apc', 'bintec', 'blue', 'c', 'C0de', 'cable-d', 'canon_ admin', 'cc', 'CISCO', 'cisco', 'community', 'core', 'CR52401', 'debug', 'default', 'dilbert', 'enable', 'field', 'field-service', 'freekevin', 'fubar', 'guest', 'hello', 'hp_admin', 'IBM', 'ibm', 'ILMI', 'ilmi', 'Intermec', 'internec', 'internal', 'l2', 'l3', 'manager', 'mngt', 'monitor', 'netman', 'network', 'NoGaH\$@!', 'none', 'openview', 'OrigEquipMfr', 'pass', 'password', 'pr1v4t3', 'private', 'PRIVATE', 'Private', 'proxy', 'publ1c', 'public', 'PUBLIC', 'Public', 'read', 'read-only', 'read-write', 'readwrite', 'red', 'regional', 'rmon', 'rmon_admin', 'ro', 'root', 'router', 'rw', 'rwa', 's!a@m#n\$p%c', 'san-fran', 'sanfran', 'scotty', 'SECRET', 'Secret', 'SECURITY', 'Security', 'seri', 'SNMP', 'snmp', 'SNMP_trap', 'snmpd', 'snmptrap', 'solaris', 'SUN', 'sun', 'superuser', 'SWITCH', 'Switch', 'SYSTEM', 'System', 'system', 'tech', 'TENmanUFactOryPOWER', 'TEST', 'test', 'test2', 'tiv0li', 'tivoli', 'trap', 'world', 'write', 'xyzzy', and 'yellow'

Default Credentials for SSH

The following usernames and passwords are common defaults for SSH:

- Usernames 'admin', 'administrator', and 'root'
- Passwords '1234', 'admin', 'changeme123', 'password', 'password1', 'password123', 'password123!', and 'toor'

Default Credentials for Telnet

The following usernames and passwords are common defaults for telnet:

- Usernames 'admin', 'administrator', 'Alphanetworks', 'cisco', 'helpdesk', 'pix', and 'root'
- Passwords '100', 'admin', 'changeme123', 'cisco', 'password', 'password1', 'password123', 'password123!', 'sanfran', 'root', 'wrgg15_di524', 'wrgg19_c_dlwbr_dir300', and 'wrgn22_dlwbr_dir615'

Default Credentials for VNC

The following usernames and passwords are common defaults for VNC:

- Usernames 'admin', 'administrator', and 'root'
- Passwords '100', '1234', 'admin', 'changeme123', 'password', 'password1', 'password123', 'password123!', and 'toor'

Default Credentials for WinRM

The following usernames and passwords are common defaults for WinRM:

- Usernames 'admin', 'administrator', and 'root'
- Passwords '1234', 'admin', 'changeme123', 'password', 'password1', 'password123', 'password123!', and 'toor'

Using Blank Passwords in a Bruteforce Attack

To generate blank passwords for each username in a password list, you can enable the **Use <BLANK> as password option**, as shown below. For example, if the password list contains a credential pair like 'admin'/'admin', Bruteforce will also try admin/'<BLANK>'.

uterorce systematically attempts to use credentials to admenticate t uterorce and the credentials you want to use to attempt authenticate	o services on target hosts. Select the hosts and services you want to in.

Getting Sessions on Guessed Credentials

In addition to guessing credentials, Bruteforce has the ability to open a session when a credential is guessed for specific services, such as MSSQL, MySQL, PostgreSQL, SMB, SSH, Telnet, WinRM, and some HTTP services, such as Tomcat, Axis2, or GlassFish. Open sessions can be used to perform post-exploitation tasks, such as gathering additional information from the host and leveraging that data to compromise additional hosts.

To open services when Bruteforce successfully cracks a credential on a service, you need to enable the **Get sessions if possible** option on and specify the payload options that you want to use, as shown below. The session will remain open after the attack finishes, which can be used to perform additional post-exploitation tasks.

Configuring Payload Settings for a Bruteforce Attack

The following options can be used to configure the payload settings:

- <u>Payload type</u>: This option determines the type of payload gets delivered to the target. You can choose one of the following options:
 - **Meterpreter**: This payload provides an advanced interactive shell that provides extensive postexploitation capabilities that enable you to do things like escalate privileges, dump password hashes, take screenshots, launch and migrate processes, and upload files to the target. Meterpreter also includes command shell capabilities for basic tasks like adding a user account or running a script.

Meterpreter also dynamically loads itself into an existing process on the target host using a technique called reflective DLL injection, which enables it to reside entirely in memory and remain undetected by intrusion prevention and intrusion detection systems.

• **Command**: This payload provides a command shell that you can use to run single commands on a host to perform simple tasks like adding a user account or changing a password. A command shell provides limited capabilities, but can be later upgraded to a Meterpreter shell for more options.

Unlike Meterpreter, a command shell can start a new process that can be easily detected by intrusion prevention and intrusion detection systems.

- <u>Connection</u>: This option determines how your Metasploit instance connects to the host. You can choose one of the following options:
 - Auto: This connection type uses a reverse connection when NAT or a firewall is detected; otherwise, it uses bind connection.
 - Bind This connection type uses a bind connection. You should use this connection type if there is a direct, unrestricted connection to the target host.
 - Reverse: This connection type uses a reverse connection. You should select this connection type
 if the hosts are behind a firewall or a NAT gateway that will prevent requests from your Metasploit
 instance to the target.
- <u>Listener ports</u>: This option defines the ports that the listener uses to wait for incoming connections. You can specify a specific port, a comma separated list of ports, or a port range. If you enter a port range, the first available open port is chosen from the range.
- <u>Listener host</u>: This option defines the IP address the target host connects back to. This is typically going to be the external IP address of your local machine. If you do not specify a listener host, the external IP address of your local machine is used.

Setting the Timeout for a Bruteforce Attack

You can control the amount of time that is allocated to the overall bruteforce task and for each individual service. You can set timeout limits from the options area of the Bruteforce Workflow, as shown below:

TARGETS	CREDENTIALS	OPTIONS
I targets selected Ject Host(s):) All hosts) Enter target addresses elect Services: 2 AIS services 2 AIS services 2 AFP Ø MSSQL Ø SSM 2 FTP Ø POP3 Ø Telast 2 HTTP Ø Pougres Ø VNC 4 HTTPS Ø SMB Ø WinRM	778 possible combinations All credentials in this project Attempt factory defaults Add Import credential para	Overall Timeout HH MM SS Hours Minutes Seconds Service Timeout SS () Seconds Image: Seconds () Time Between Normal (0 seconds) () Apply mutation(s) () () Stop bruteforcing a target when a credential is guessed () Get sessions if possible ()

The following timeout options are available:

- Service timeout Sets the timeout, in minutes, for each service.
- Overall timeout Sets the maximum amount of time, in minutes, that will be allocated for the bruteforce run. If an overall timeout is enforced, Bruteforce will attempt as many guesses as it can during that timeframe. Bruteforce may not be able to attempt all credentials if a timeout is set.
- **Timeout between attempts** Sets the time that elapses, in seconds, between each login attempt. You can choose between any of the predefined time limits: Normal (0 seconds), Stealthy (5 seconds), Slow (10 seconds), and Glacial (60 seconds).

If no timeout options are set, the Bruteforce Workflow defaults to 0 and does not enforce a timeout limit.

Applying Mutation Rules for a Bruteforce Attack

Oftentimes, organizations use variations of a base word to configure default account settings, or they use leetspeak to substitute characters. To cover these particular scenarios, you can to apply mutation rules to create different permutations of a private.

A mutation rule appends, prepends, and substitutes characters in a private. You can use them to effectively build a larger list of passwords based on a set of base words. For example, if you have identified that an organization commonly uses passwords that contain the company's name, you can add the company's name to the word list and apply mutations to automatically generate multiple variations of it. Therefore, depending on the mutation rules that are applied, a private, like "mycompany" can have several variations, such as "mycompany2014", "mycompany1", "mycomp@ny", and so on.

There are several different types of mutation rules that you can apply, such as appending and prepending digits to a private, applying leetspeak substitutions to a private, and appending and prepending the current year to a private. The mutation rules are disabled by default, so you will need to enable the mutation option and select the rules you want to use. If enabled, the mutation rules will be applied to the credentials you have selected for the bruteforce attack.

Applying mutations can substantially increase the amount of time that it takes Bruteforce to complete. If you attempt to run Bruteforce with all mutation options enabled, it may take a very long time to complete. We highly recommend that you do not run Bruteforce using factory defaults and all mutation options because the task may take days to finish.

Applying Leetspeak Substitutions

Leetspeak is an alternative alphabet that can be used to substitute letters with special characters and numbers.

You can enable the **1337 speak** option to perform individual leetspeak substitutions on a private. If you enable the 1337 speak option, the following rules are applied to each private:

- The mutation rule changes all instances of the letter "a" to "@".
- The mutation rule changes all instances of the letter "a" to "4".
- The mutation rule changes all instances of the letter "e" to "3".
- The mutation rule changes all instances of the letter "I" to "1".
- The mutation rule changes all instances of the letter "o" to "0".
- The mutation rule changes all instances of the letter "s" to "5".
- The mutation rule changes all instances of the letter "s" to "\$".
- The mutation rule changes all instances of the letter "t" to "7".

Each leetspeak rule is applied individually. For example, if the private is "mycompany", the leetspeak mutation rule creates two permutations: "myc0mpany" and "mycomp@ny". It does not combine leetspeak rules to create "myc0mp@ny".

Prepending Special Characters (!#*)

You can enable the **Prepend special characters** option to add a special character to the beginning of a private. If enabled, the rule prepends an exclamation point (!), a hash symbol (#), an ampersand (&), and an asterisk (*) to a private. For example, if the private is "mycompany", the following permutations are created: "!mycompany", "#mycompany", "&mycompany", and "*mycompany".

Appending Special Characters (!#*)

You can enable the **Append special characters** option to add a special character to the end of a private. If enabled, the rule appends an exclamation point (!), a hash symbol (#), an ampersand (&), and an asterisk (*) to a private. For example, if the private is "mycompany", the following permutations are created: the following permutations are created: "mycompany!", "mycompany#", "mycompany&", and "mycompany*".

Prepending a Single Digit

You can enable the **Prepend single digit** option to add a single digit to the beginning of a private. If enabled, the rule prepends the digits 0-9 to a private. For example, if the private is "mycompany", the following permutations are created: "mycompany0", "mycompany1", "mycompany2", "mycompany3", and so on.

Appending Single Digit

You can enable the **Append single digit** option to add a single digit to the end of a private. If enabled, the rule appends the digits 0-9 to a private. For example, if the private is "mycompany", the following permutations are created: "0mycompany", "1mycompany", "2mycompany", "3mycompany", and so on.

Prepending Digits

You can enable the **Prepend digits** option to add three digits to the beginning of a private. For example, if the private is "mycompany", the following permutations are created: "mycompany000", "mycompany001", "mycompany002", "mycompany003", and so on.

Note: If enabled, this rule can generate up to 1,000 permutations of a single private.

Appending Digits

You can enable the **Append digits** option to add three digits to the end of a private. For example, if the private is "mycompany", the following permutations are created: "000mycompany", "001mycompany", "002mycompany", "003mycompany", and so on.

Note: If enabled, this rule can generate up to 1,000 permutations of a single private.

Prepending the Current Year

You can enable the **Prepend current year** option to add the current year to the beginning of a private. For example, if the private is "mycompany", the following permutations are created: "2014mycompany",

"2014mycompany", "2014mycompany", "2014mycompany", and so on.

Appending the Current Year

You can enable the **Append current year** option to add the current year to the end of a private. . For example, if the private is "mycompany", the following permutations will be created: "mycompany2014", "mycompany2014", and so on.

Launching the Bruteforce Attack

The Launch button on the Bruteforce configuration page becomes active when all required fields have been filled out. When you are ready to run the bruteforce attack, click the **Launch** button.

TARGETS	CREDENTIALS	OPTIONS
64 targets selected Select Host(s):	778 possible combinations All credentials in this project	Overall Timeout HH MM SS Hours Minutes Seconds
 All hosts Enter target addresses 	 Attempt factory defaults Add/Import credential pairs 	Service Timeout SS Seconds
Select Services:		Time Between Attempts Normal (0 seconds)
 ✓ AFP ✓ MSSQL ✓ SNMP ✓ DB2 ✓ MySQL ✓ SSH ✓ FTP ✓ POP3 ✓ Telnet 		Apply mutation(s)
 ✓ HTTP ✓ Postgres ✓ VNC ✓ HTTPS ✓ SMB ✓ WinRM 		Stop bruteforcing a target when a credential is guessed
		Get sessions if possible

If there are any issues with the attack configuration, a warning will appear next to the misconfigured setting. You must fix the issue before you can launch the bruteforce attack.

Understanding Bruteforce Findings

After you launch the bruteforce attack, the findings window appears and displays the real-time results and events for the attack. To help you navigate the data, the findings window is organized into two major tabs: the Statistics tab and the Task Log tab.

Home $>$ default $>$	Tasks Task 4							
Bruteforce Comple	eted							
Statistics Ta	Statistics Task Log							
	48/48 LOGIN ATTEMPTS		TA	2/6 RGETS COMPROMISED		4/48 SUCCESSFUL LOG	INS	
Export	Eport Login Attempts

The Statistics Tab

The Statistics tab tracks the real-time results for the following:

- The total number of login attempts
- The total number of targets compromised
- The total number of successful logins

Each statistic is displayed on its own tab. You can click on a tab to view the corresponding table for each statistic.

teforce Completed							
tatistics Task Log							
	48 48/48 LOGIN ATTEMPTS		TAF	2 2/6 RGETS COMPROMISED		4/48 SUCCESSFUL L	OGINS

Viewing the Login Attempts Table

The Login Attempts table displays every login that the bruteforce attack has tried. The following information is listed for each login:

- The IP for each host
- Host name
- Service name
- Service port
- Public
- Private
- Realm type
- Login result

Viewing the Targets Compromised Table

The Targets Compromised table displays every target to which the bruteforce attack was able to successfully authenticate. The following information is listed for each compromised target:

- Host IP
- Host name
- Operating system
- Service name
- Service port
- Number of captured credentials
- Sessions*

* If you configured the bruteforce attack to get sessions, the Targets Compromised table includes a Sessions column that lists the total number of sessions that were opened on each target. You can hover over the session count to view a list of links that you can use to access the details page for each session.

Viewing the Successful Logins Table

The Successful Logins table displays all the logins that the bruteforce attack was able to validate. The following information is listed for each login:

- Host IP
- Host name

- Operating system
- Service name
- Service port
- Public
- Private
- Realm type
- Sessions details*

* If you configured the bruteforce attack to get sessions, the Targets Compromised table has a Go to Sessions column that displays a link for each open session. You can click on the link to access the details page for the session. If you did not configure the bruteforce attack to get sessions, the Targets Compromised table has an Attempt Session column, which enables you to try to validate the login from the findings window.

The Task Log Tab

The task log tracks the activity for the bruteforce attack. It lists the target that is being bruteforced and the result for each guess attempt. A successful login will be highlighted in yellow, as shown below:

Bruteforce Findings

[*] [2014.12.03-14:23:01] 10.20.36.53:22 INCORRECT - dom [*] [2014.12.03-14:23:01] 10.20.26.53:445 INCORPECT - WO	IN:1234					
[*] [2014.12.03-14:23:01] 10.20.36.53:139 INCORRECT - WO	RKSTATION\admin:password					
[*] [2014.12.03-14:23:01] 10.20.36.53:445 INCORRECT - WO	RKSTATION\admin:password123!					

The task log also documents any errors or failures that occurred during the attack and can be used to troubleshoot any issues related to the bruteforce run. This is especially helpful if, for example, the attack has been running for a long time, appears to be hanging, or does not complete.

Custom Credential Mutations

Credential mutations mangle the passwords in a wordlist. You can use them to create numerous permutations of a password, such as switch out letters for numbers (password becomes "passw0rd"), thus enabling you to build a large wordlist based on a small set of passwords.Credential mutations can also add numbers and special characters to a password, toggle the casing of letters, and control the length of a password.

Metasploit Pro offers several canned mutations that you can use. However, if you want to generate a custom mutated credentials list, you will need to run your wordlist through a password cracking tool like John the Ripper. John the Ripper will apply a set of mangling rules to the wordlist and output a list of mutated credentials that you can import into a project.

John the Ripper

John the Ripper is a free password cracker that is available for many flavors of Unix, Windows, DOS, BeOS, and OpenVMS. John the Ripper is typically used to detect weak passwords and hashes, but you can also use it to generate a mutated wordlist that you can import into Metasploit to use with Bruteforce.

Downloading and Installing John the Ripper

The Metasploit installer includes the binaries for John the Ripper 1.7.8, which are located in path/to/metasploit/apps/pro/msf3/data/john. To run John the Ripper, you'll need to simply invoke the binary from the run directory for your target. If you want the latest version of John the Ripper, you will need to install it. John the Ripper has extensive installation instructions located at http://www.openwall.com/john/doc/INSTALL.shtml. However, if you'd rather learn from us, read on.

To start, you will need to download John the Ripper at http://www.openwall.com/john/. A free, community enhanced, and commercial version of John the Ripper are available. Download the version that works for your system.

John the Ripper is distributed primarily in source code form and downloaded as an archive file. After you download the archive file, you will need to extract its contents. To run John the Ripper, you will simply need to invoke it from the extraction location.

Installing John the Ripper on Linux

Open a terminal and type the following:

```
sudo -sH
cd /opt
wget http://www.openwall.com/john/j/john-1.8.0.tar.gz
tar -xvzf john-1.8.0.tar.gz
mv john-1.8.0 john
rm john-1.8.0.tar.gz
```

Note: If you are using a different version of John the Ripper, replace 1.8.0 with the version you have.

```
cd /opt/john/src make
```

Make displays a list of targets. Choose the best one for your architecture and rerun the make command with the target you have chosen. For example, for a Linux x86-64 system, type the following:

make clean linux-x86-64

John the Ripper is now installed on your Linux system and is ready to use.

Installing John the Ripper on Windows

1. Go to http://www.openwall.com/john and download the latest Windows installer.

The binaries for Windows will be available in a ZIP file.

 Locate the downloaded file and extract it to your C drive. The resulting directory will be something like C:\john179.

If you are using a different version of John the Ripper, replace john179 with the version you have.

3. Rename the directory to john. The resulting directory will be C:\john.

John the Ripper is now installed on your Windows system and is ready to use.

Running John the Ripper on Linux

Open the command line terminal and type the following:

```
sudo -sH
cd /path/to/john/run
./john
```

Replace /path/to/ with the location where you have John the Ripper installed.

John the Ripper prints a list of options that are available. For more information on John the Ripper options, see http://www.openwall.com/john/doc/OPTIONS.shtml.

Running John the Ripper on Windows

Open the command line terminal (Start > Run > cmd) and type the following:

```
cd \path\to\john\run
john
```

Replace $\path\to\with the location where you have John the Ripper installed.$

John the Ripper prints a list of options that are available. For more information on John the Ripper options, see http://www.openwall.com/john/doc/OPTIONS.shtml.

Custom Mutation Rules

Now that you have John the Ripper installed and verified that it runs, you can add mutation rules to the John configuration file. A rule enables you to perform a specific type of mutation on a word. For example, you can create a rule that appends specific special characters, such as $[!@#$%^&*()+=.?]$, to every word in the wordlist.

To define custom mutation rules, you will need to create rule sets in the John configuration file. A rule set is a logical grouping of related mutation rules. All mutation rules must be contained within a rule set. For example, you should create separate rule sets for rules that append characters, rules that prepend characters, and rules that control character lengths. You will need to supply the rule sets as part of the rules option when you generate the wordlist, like the following:

```
./john --wordlist=[path to word list] --stdout --rules:[ruleset name] >
[path to output list]
```

Custom Rule Set Requirements

Each rule set section must start with its type and name enclosed in brackets. Rule sets must use the following format: [List.Rules:<name>], where <name> is replaced with the name of the rule set.

For example, if you have a rule set named AppendLowercaseNumbers, the section must be written as [List.Rules:AppendNumbers] in the John configuration file.
So, your rule set will look something like this:

```
[List.Rules:AppendLowercaseNumbers]
#lowercase and add numbers to the end of a password
l$[0-9]
l$[0-9]$[0-9]
l$[0-9]$[0-9]$[0-9]
l$[0-9]$[0-9]$[0-9]
```

Also, here are a couple of other formatting rules that you should remember:

- Section names are not case sensitive.
- Comment lines start with a hash ("#") or a semicolon (";").
- Empty lines are ignored.
- Rule sets can be placed anywhere in the John configuration file, but as a best practice, you should add them to the bottom of the file.

Accessing the John Configuration File

To access the John configuration file, go to /path/to/john/run. The configuration file will be named either john.conf or john.ini depending on your operating system. You will need to open the configuration file using a text editor, like Vim (Linux) or Notepad (Windows).

```
sudo -sH
cd /opt/john/run
vim john.conf
```

If you do not have Vim, you can install it with the following command: apt-get install vim.

The configuration file consists of several sections. Each section has a unique function and is assigned a section name that is enclosed in square brackets, as shown below:

```
# This file is part of John the Ripper password cracker,
# Copyright (c) 1996-2006,2008-2013 by Solar Designer

# There's ABSOLUTELY NO WARRANTY, express or implied.
# Please note that although this configuration file is under the cut-down BSD
# license above, many source files in John the Ripper are under GPLv2.
# For licensing terms for John the Ripper as a whole, see doc/LICENSE.
[Options]
# Wordlist file name, to be used in batch mode
Wordlist = $JOHN/password.lst
# Use idle cycles only
Tdle = Y
# Crash recovery file saving delay in seconds
Save = 600
# Beep when a password is found (who needs this anyway?)
Beep = N
# "Single crack" mode rules
[List.Rules:Single]
# Simple rules come first...
-s x**
-c (?a c Q
-c 1 0
-s-c x** /?u l
```

Basic John the Ripper Rules Syntax

John the Ripper has great documentation that explains the syntax for building rules. You can read them at http://www.openwall.com/john/doc/RULES.shtml. It is highly recommended that you review their documentation before building your own custom rules.

To help you get started, here is a quick overview of some of the commands you might be interested in:

- \$ appends a character or number to a word. You can define a single character, such as \$1, which will append the number 1 to a password, or you can define a group of characters, such as \$[0-9], which will append 0, 1, 2, 3, 4, 5, 6, 7, 8, and 9 to a password.
- ^ prepends a character or number to a word. You can define a single character, such as ^1, which will
 prepend the number 1 to a password, or you can define a group of characters, such as ^[0-9], which will
 prepend 0, 1, 2, 3, 4, 5, 6, 7, 8, and 9 to a password.
- I converts all the letters in the word to lowercase.
- c converts all of the letters in the word to uppercase.
- C lowercases the first character in the word and uppercases the rest.
- t toggles the case of all characters in the word.

You can use any combination of commands within a rule. For example, you can create rules that prepends and appends numbers to a password, such as [0-9]; [0-9]. Each rule must appear on a newline.

Creating Custom Mutation Rules

Now, let's go ahead and add some mutation rules to the John configuration file.

The following mutations are covered:

- Appending a number to a password.
- Prepending a number to a password.
- Appending special characters to a password.
- Prepending special characters to a password.
- Lowercasing the password and adding special characters and numbers to it.
- Uppercasing the password and adding special characters and numbers to it.

To add these rules, open the John configuration file with a text editor and scroll to the bottom of the file. You can copy and paste any of these rules to the John configuration file, or you can use these as examples to build your own rules. After you have added the rules to the John configuration file, remember to save your changes.

Before you make any modifications to the John configuration file, you should make a copy of the original file in case you need to revert back to it.

Appending Numbers to a Password

```
[List.Rules:AppendNum]
#Appends one, two, and three numbers to a password
$[0-9]
$[0-9]$[0-9]
$[0-9]$[0-9]
$[0-9]$[0-9]
```

Prepending Numbers to a Password

```
[List.Rules:PrependNum]
#Prepends one, two, and three numbers to a password
^[0-9]
```

^[0-9]^[0-9] ^[0-9]^[0-9]^[0-9]

Appending Special Characters to Passwords

```
[List.Rules:AppendSpecialChar]
#Appends one, two, and three special character to a password
$[!@#$%^&*()+=.?]
$[!@#$%^&*()+=.?]$[!@#$%^&*()+=.?]
$[!@#$%^&*()+=.?]$[!@#$%^&*()+=.?]$[!@#$%^&*()+=.?]
```

Prepending Special Characters to a Password

```
[List.Rules:PrependSpecialChar]
#Prepends one, two, and three special character to a password
^[!@#$%^&*()+=.?]
^[!@#$%^&*()+=.?]^[!@#$%^&*()+=.?]
^[!@#$%^&*()+=.?]^[!@#$%^&*()+=.?]
```

Lowercasing the Password and Appending Numbers and Special Characters

```
[List.Rules:LowercaseNumChar]
#Lowercases all of the letters of the password and adds a number and/or
special character to it

1
1
1$[0-9]
1$[0-9]$[0-9]
1$[!0#$%^&*()+=.?]
1$[!0#$%^&*()+=.?]
1$[0-9]$[!0#$%^&*()+=.?]
1$[0-9]$[!0#$%^&*()+=.?]
1$[0-9]$[!0#$%^&*()+=.?]$[!0#$%^&*()+=.?]
```

Uppercasing the Password and Appending Numbers and Special Characters

```
[List.Rules:UppercaseNumChar]
#Uppercases all of the letters of the password and adds a number and/or
special character to it
u
us[0-9]
u$[0-9]$[0-9]
u$[!@#$%^&*()+=.?]
u$[!@#$%^&*()+=.?]
u$[!@#$%^&*()+=.?]
u$[0-9]$[!@#$%^&*()+=.?]
u$[0-9]$[!@#$%^&*()+=.?]
```

Generating the Mutated Wordlist

When you are ready to generate the mutated wordlist, you will need to run the following: --wordlist= [path to the pre-mutated wordlist] --stdout --rules:[rule set name] > [path to the generated list]. You will need to invoke John the Ripper using the appropriate method for your operating system.

John the Ripper will generate the wordlist using the rules that you have specified. If you want to apply all the rules in the configuration file to the wordlist, you can just specify the --rules option.

Generating the Wordlist on Linux

```
./john --wordlist=[path to the wordlist] --stdout --rules:[rule set name]
> [path to the generated list]
```

You must replace the brackets with the appropriate information. For example:

```
./john --wordlist=password.lst --stdout --rules:PrependSpecialChar >
/home/usr/Desktop/mutatedpswds.lst
```

Generating the Wordlist on Windows

```
john --wordlist=[path to the wordlist] --stdout --rules:[rule set name] >
[path to the generated list]
```

You must replace the brackets with the appropriate information. For example:

```
john --wordlist=password.lst --stdout --rules:PrependSpecialChar >
/Desktop/mutatedpswds.lst
```

Importing John the Ripper Wordlists in to a Project

- 1. Go the Manage Credentials screen.
- 2. Click the **Add** button.
- 3. When the Add Credentials window appears, select the Import option.
- 4. Click the Browse button and navigate to the location of the wordlist you want to import.

The file must be a .txt or .lst file.

- 5. Select the file and click **Open**.
- 6. From the Add Credentials window, select Wordlist as the format.
- 7. Click the File Type dropdown and select Passwords.
- 8. Enter tags for the passwords in the wordlist. (Optional)

Tags will help you easily search for and identify certain passwords. To enter a tag, start typing the name of the tag you want to use in the **Tag** field. As you type in the search box, Metasploit Pro automatically predicts the tags that may be similar to the ones you are searching for. If the tag does not exist, Metasploit Pro creates it.

9. Click OK.

The wordlist is imported into the project. You can go to the Manage Credentials page to view the imported credentials.

Credentials Domino MetaModule

The Credentials Domino MetaModule enables you to determine how far an attacker can get in a network if they are able to obtain a particular credential. It is performs an iterative credentials-based attack to identify the attack routes that are possible if a session is obtained or a credential is captured from a particular host. Its purpose is to help you gauge the impact of a credentials-based attack by reporting the number of hosts that can be compromised and the number of unique credentials can be captured by leveraging a particular credential.

In order to run the Credentials Domino MetaModule, the project must have at least one valid login or one open session that you can use as the starting point. As previously mentioned, the Credentials Domino MetaModule performs an iterative attack, which means that it repeatedly cycles through the network and attempts to authenticate to each host with a particular credential. Each iteration represents a single cycle through a network with a different credential. The Credentials Domino MetaModule continues to run until it opens a session on every target host or it reaches a termination condition.

During the first iteration, if you choose to start with a valid login, the Credentials Domino MetaModule immediately tries to use it to authenticate to and open a session on each target host. If the Credentials Domino MetaModule is able successfully authenticate and open a session, it captures the credentials from the host and stores them in the project. Once the MetaModule has successfully opened a session on a host, it will not try the host again. However, if you choose to start with an open session, the MetaModule begins by collecting credentials from the session. Then, it tries each looted credential until it is able to find a successful login. The MetaModule uses the successful credential to start the next iteration.

To help you see how the network is impacted, the MetaModule includes a specialized report that documents the technical findings and results from the attack. It also presents real-time results for compromised hosts and captured credentials through the findings window and presents a visualization of the attack patterns that it was able to establish from the target network.

Accessing the Credentials Domino MetaModule

You can access the Credentials Domino MetaModule from the MetaModules page. To access the MetaModules page, select **Modules > MetaModules** from the Project tab bar. Find the Credentials Domino MetaModule and click the **Launch** button.

The Credentials Domino MetaModule configuration window appears with the **Select Initial Host** configuration form displayed. Each configuration step is divided into separate tabs, so you can click on any of the tabs to switch between the different configuration forms.

Selecting the Initial Host for the Credentials Domino MetaModule

The first thing you need to do when you configure the Credentials Domino MetaModule is select the host that has the login or session you want to use. From the **Select Initial Host** tab, you can see a list of all hosts in the project that either have valid logins or open sessions.

aect initial Most	Choose a host from	the list below					
cope			٩				0
ettings	HOST IP -	HOST NAME	OS	SERVICES	LOGINS	SESSIONS	TAGS
	0 10.20.36.53	MS-W03R2-3U-1	Windows 2003 R2	3 services	7 logins	1 session	0 tags

Select the host that you want the MetaModule to use. The login and session details for the host appears after you select a host.

Defining the Scope for the Credentials Domino MetaModule

The scope identifies the hosts that you want the MetaModule to target during the attack. To define the scope, you use the **Target addresses** and **Excluded addresses** fields.

ect Initial Host	Enter the hosts you want to attack		
pe	Target addresses	Excluded addresses	
ings			
Generate Report			6
	High Value Hosts Enter IP range or address(es) of high value hosts.	High Value Host Tags Enter the tags you applied to high value hosts.	?

If there are specific hosts that you want to attack, you can enter them in the **Target addresses** field. You can enter a single address (192.168.1.1), a range (192.168.1.1-192.168.1.100), a CIDR notation (192.168.1.0/24), or a wildcard (192.168.1.*). You must use a newline to separate each entry. If you want to include all hosts in the project, you can leave this field empty.

ct Initial Host	Enter the hosts you want to attack		
	Target addresses	Excluded addresses	(
)e	10.20.36.55 10.20.37.0		
ings			
enerate Report			
	High Value Hosts ?	High Value Host Tags	?
	Enter IP range or address(es) of high value hosts.	Enter the tags you applied to high value hosts.	

If there are specific hosts that you want to exclude from the attack, you can enter them in the **Excluded addresses** field. Again, you can specify an address range, a CIDR notation, a comma separated list of host addresses, or a single host address.

Select Initial Host	Enter the hosts you want to attack

Generate Report		~	
	High Value Hosts	? High Value Host Tags	?
	Enter IP range or address(es) of high value hosts.	Enter the tags you applied to high value hosts.	

Designating High Value Hosts for the Credentials Domino MetaModule

A High Value Host is a designation that you assign to a host that you want to highlight on the Credentials Domino Findings window and in the Credentials Domino MetaModule Report. The High Value Host designation helps you quickly identify the impact of a particular stolen credential pair against critical hosts. A High Value Host designation indicates that the host is of significant importance to an organization, and any attack against the host could negatively impact business operations. For example, domain controllers and servers that contain sensitive financial information may be considered as High Value Hosts.

All High Value Hosts will be highlighted in orange on the Findings window, as shown below in the visualization graph:

Credentials Domino Failed		×
Statistics Task Log		
1	1	1 Designated High Value Host
Iterations	Unique credentials captured	Hosts compromised
★ ★	US-VEI23-2-1	High value target
		Close

There are a couple of ways you can designate a host as a high value host:

• You can apply host tags - You can apply tags to the hosts that are critical to an organization, which enables you to track, group, and report on hosts according to how they impact an organization. Tags enable you to view and filter hosts at the project level.

For example, you may want to tag all accounting servers with a label like, accounting. You may also want to want to create and apply criticality tags, such as High, Medium, and Low, to isolate hosts based on their criticality levels.

Credentials Domino Performs an iterative creder) htials-based attack against a set of targets using a valid logir	i or open session.	×

Settings			
Generate Report			
	High Value Hosts Enter IP range or address(es) of high value hosts.	High Value Host Tags Enter the tags you applied to high value hosts. high ×	(?)
	Cancel	nch	

• You can specify high value hosts from the Credentials Domino MetaModule - You can also designate high value hosts by their addresses. You can enter an address range, a single address, or a new line separated list of addresses.

For example, if you know the IP address for a particular host that is of special interest to you, you can specify it when configuring the scope for the Credentials Domino MetaModule. Use this method if you want to manually define the hosts you want to designate as High Value Hosts and do not want to use tags.

Configuring Payload Settings

..

You can specify the payload that you want the Credentials Domino MetaModule to deliver during the attack. To configure the payload settings, you can use the following options, which are located on the **Settings** tab:

- <u>Payload type</u>: This option determines the type of payload that the MetaModule delivers to the target. You can choose one of the following options:
 - **Meterpreter**: This payload provides an advanced interactive shell that provides extensive postexploitation capabilities that enable you to do things like escalate privileges, dump password hashes, take screenshots, launch and migrate processes, and upload files to the target. Meterpreter also includes command shell capabilities for basic tasks like adding a user account or running a script.

Meterpreter also dynamically loads itself into an existing process on the target host using a technique called reflective DLL injection, which enables it to reside entirely in memory and remain undetected by intrusion prevention and intrusion detection systems.

• **Command**: This payload provides a command shell that you can use to run single commands on a host to perform simple tasks like adding a user account or changing a password. A command shell provides limited capabilities, but can be later upgraded to a Meterpreter shell for more options.

Unlike Meterpreter, a command shell can start a new process that can be easily detected by intrusion prevention and intrusion detection systems.

- <u>Connection</u>: This option determines how your Metasploit instance connects to the host. You can choose one of the following options:
 - Auto: This connection type uses a reverse connection when NAT or a firewall is detected; otherwise, it uses bind connection.
 - Bind: This connection type uses a bind connection. You should use this connection type if there is
 a direct, unrestricted connection to the target host.
 - Reverse: This connection type uses a reverse connection. You should select this connection type
 if the hosts are behind a firewall or a NAT gateway that will prevent requests from your Metasploit
 instance to the target.
- <u>Listener ports</u>: This option defines the ports that the listener uses to wait for incoming connections. You can specify a specific port, a comma separated list of ports, or a port range. If you enter a port range, the first available open port is chosen from the range.
- <u>Listener host</u>: This option defines the IP address the target host connects back to. This is typically going to be the external IP address of your local machine. If you do not specify a listener host, the MetaModule automatically uses the external IP address of your local machine.
- <u>Clean up sessions</u>: This option enables you to close all open sessions after the MetaModule finishes. By default, this option is enabled. If you want to keep the sessions open, deselect this option.

Setting Termination Conditions for the Credentials Domino MetaModule

You can control the number of times that the Credentials Domino MetaModule cycles through a target network by setting iteration and timeout controls. If you do not set iteration or timeout conditions, the Credentials Domino MetaModule will run until it exhausts all credential and host combinations. Depending on the scope of the attack and the number of credentials captured, the attack can go through a large number of iterations.

To set termination conditions, you use the following options, which are located on the Settings tab:

- <u>Number of iterations</u>: This option sets a limit on the number of iterations the MetaModule attempts. You can leave the fields blank if you want the MetaModule to continue until it runs out of credentials to try.
- Overall timeout: This option sets a timeout limit for how long the MetaModule can run in its entirety. You can specify the timeout in the following format: HH:MM:SS. You can leave the fields blank to set no timeout limit.

• <u>Service timeout</u>: This option sets a timeout, in seconds, for each target. You can leave the fields blank to set no timeout limit.

Including a Generated Credentials Domino MetaModule Report

The Credentials Domino MetaModule Report documents the results and technical findings from a credentials-based attack. You can view the report to determine how a validated login or opened session impacted the target network.

To include a Credentials Domino MetaModule Report, you just need to enable the report option.

	All Uncompromised Hosts		
	Appendix: Report Options		
	Excluded addresses (2)	Email Benort	

If you choose to automatically generate a report, you can customize the report using any of the following options:

- Format: The report can be generated as an HTML, PDF, or RTF file. You must select at least one format for the report.
- <u>Name</u>: The report has a default name based on the MetaModule and current date. You can use the default name or provide a custom report name.
- <u>Sections</u>: The report includes the following sections: Cover Page, Project Summary, Findings Summary, Authenticated Services and Hosts Summary Charts, Authenticated Services and Host Details, and Appendix. By default, the report includes all sections. You can deselect any sections that you do not want to include in the report.
- <u>Mask discovered credentials</u>: The report displays all captured credentials in plaintext. If you want to mask the credentials from the report, you must enable this option.

- Include charts: The report includes several charts and graphs that visualize the results from the attack. If you do not want to include visualizations in the report, you must enable this option.
- <u>Excluded addresses</u>: The report includes data for all hosts that you included in the scope. If there are specific hosts whose data you do not want to include in the report, you can list them in this field.
- <u>E-mail report</u>: You can e-mail the report after it is generated. To e-mail the report, you must enter a comma separated list of e-mail addresses in this field.

Please note that you must already have a local mail server or e-mail relay service set up for Metasploit Pro to use. To define your mail server settings, go to **Administration > Global Settings > SMTP Settings**.

You can only generate a MetaModule report from the MetaModule. If you do not include a generated report when you configure the MetaModule, you will not be able to do so later.

Launching the Credentials Domino MetaModule

When you are ready to run the Credentials Domino MetaModule, you can click the Launch button.

Select Initial Host	Report is enabled	HTML PDF RTF WORD

	Summary Charts	
	Compromised High Value Hosts	
	 Uncompromised High Value Hosts 	
	All Compromised Hosts	
	All Uncompromised Hosts	
	Appendix: Report Options	
	Excluded addresses (2)	Email Beport

Understanding the Credentials Domino MetaModule Findings

After you launch the Credentials Domino MetaModule, the findings window appears and displays the realtime results and events for the attack. You can quickly see the impact of the attack on the target network and identify the possible attack routes. To help you navigate the data, the findings window is organized into two major tabs: the Statistics tab and the Task Log tab.

Credentials Domino		×
Statistics Task Log		
1	Unique credentials captured	2 Designated High Value Hosts Hosts compromised
Iterations		
<u>₩</u> +4 ×	U MUCOLI	
	UB 492342-30-1	

The Statistics Tab

The Statistics tab tracks the real-time results for the attack. It displays statistics for the following:

- The total number of iterations that the MetaModule performed
- The total number of captured credentials
- The total number of compromised hosts

Each statistic is displayed on its own tab. You can click on any of the tabs to view the corresponding details for the statistic.

Viewing the Attack Visualization

To help you visualize the attack routes that the MetaModule was able to establish, the findings window includes an attack visualization that graphically shows the relationship and hierarchy between each compromised host on the network. The visualization uses a tree structure and presents each host as a node on the tree. The starting node is the initial host that the MetaModule used to start the attack.

The attack visualization uses a hierarchical format to connect hosts that are linked to other hosts. The connection between two nodes is created when a credential from one host is used to compromise another host. You can mouseover a node in the attack visualization to highlight the attack route that was used compromise the host.

Each iteration represents a level on the tree, so the attack visualization can become quite large if the MetaModule performed multiple iterations of the attack. For example, if the MetaModule performed 20 iterations of an attack, there will be 20 levels represented on the attack visualization. If this happens, you can scroll or double-click the tree to zoom in to view a smaller set of nodes, or you can hover over a specific node to see the details for that host, such as the host name, operating system, credential information, and captured credentials count.

Viewing the Unique Credentials Captured

The Credentials Domino MetaModule tracks credentials that do not share the same public, private, and realm with other captured credentials. It displays this count on the **Unique Credentials Captured** tab and continuously updates the count in real-time.

For each unique credential captured, the **Unique Credentials Captured** table shows the public value, private value, realm type, source host IP, source host name, and the number of hosts from which the credential was captured.

atistics Task Log						
	1 Iterations		15 Unique credentials captured		26 Hosts compromised	
Export			Unique Credentials Captured			
PUBLIC	▼ PRIVATE	REALM	CAPTURED FROM	HOST NAME	COMPROMISED HOSTS	
support_388945e0	NTLMHesh		10.20.36.73	MS-WXP-3U-1	0 hosts	
support_388945a0	NTLMHash		10.20.36.76	MS-WXP-6U-1	0 hosts	
upport_388945e0	NTLMHash		10.20.36.53	MS-W03R2-3U-1	0 hosts	
shd	BlankPassword		10.20.36.53	MS-W03R2-3U-1	0 hosts	
shd	NTLMHash		10.20.36.53	MS-W03R2-3U-1	0 hosts	
100	NTLMHesh		10.20.36.84	SMB-W2012-64	0 hosts	
elpassistant	NTLMHash		10.20.36.73	MS-WXP-3U-1	0 hosts	
uest	BlankPassword		10.20.36.53	MS-W03R2-3U-1	0 hosts	
uest	NTLMHash		10.20.36.53	MS-W03R2-3U-1	0 hosts	
	NTI MHash	Active Directory	10 20 36 53	MS-W03R2-3U-1	20 hosts	

If the credential is a hash or an SSH key, the **Private** field displays the credential type instead of the private value. You can click on the private type to view the private value.

The Task Log Tab

The task log tracks the activity for the MetaModule, such as the host and credential pair combinations that have been attempted and the results of those attempts. The task log also documents any errors or failures that occurred during the attack and can be used to troubleshoot any issues related to the MetaModule run. This is especially helpful if, for example, the MetaModule has been running for a long time, appears to be hanging, or does not complete.

Single Credential Testing MetaModule

The Single Credential Testing MetaModule recycles a known credential pair to identify additional systems that can be authenticated. You can run this MetaModule to demonstrate how password reuse could expose major weaknesses in an enterprise's security posture. A single cracked password can enable you to easily compromise other systems that share the same password.

To use the Single Credential Testing MetaModule, you need to provide it with a known credential pair that you've uncovered through a scan, bruteforce attack, or phishing attack. When you configure this MetaModule, you need to define the target hosts and the services that you want to attempt to authenticate. After the MetaModule completes its run, it generates a report that details the hosts on which it was able to authenticate the credentials.

Lockout Risks

An account lockout disables an account and prevents you from accessing the account for the duration of the lockout period. When you configure the Single Credential Testing MetaModule, you should factor in the lockout risk for the services that you choose.

Each service is categorized into the following lockout risks:

- Low Risk: Any service that typically does not enforce account lockouts, such as AFP, DB2, EXEC, FTP, HTTP, HTTPS, LOGIN, Oracle, Postgres, SHELL, SNMP, SSH_PUBKEY, Telnet, and VNC.
- <u>Medium Risk</u>: Any service that typically enforces account lockouts, such as MSSQL, MySQL, POP3, and SSH.
- <u>High Risk</u>: Any service that uses Windows authentication, such as PC Anywhere, SMB, vmauthd, and WinRM.

Running the Single Credential Testing MetaModule

- 1. From within a project, select **Modules > MetaModules**.
- 2. Find the **Single Credential Testing** MetaModule and click the **Launch** button. The Single Credential Testing window appears.

MetaModules Categories:	SSH Key Testing Credentials	Single Password Testing Discovery Credentials	Pass the Hash Discovery Intrusion
Audding (1) Credentials (2) Decovery (4) Hrussion (2) Penetration Testing (2) Added testing: Added testinget Added testinget Added testing: Ad	This Metal/doule attempts to log in to systems with a recovered SSH key and records the success and failure results for each service. Findings Summary	Options Selected
Authenticated Services and Hosts Summary Charts	

12. Select the **Email Report** option if you want to e-mail the report after it generates. If you enable this option, you need to supply a comma separated list of e-mail addresses.

Note: If you want to e-mail a report, you must set up a local mail server or e-mail relay service for Metasploit Pro to use. To define your mail server settings, select **Administration > Global Settings > SMTP Settings**.

13. Click the Launch button.

When the MetaModule launches, the Findings window appears and displays the real-time statistics and tasks log for the MetaModule run. You can track the total number of hosts that the MetaModule attempted to authenticate, the total number of login attempts, and the total number of successful logins. If you want to view all the event details, you can click on the Task Log tab.

After the MetaModule completes its run, you should go the Reports area to view the Single Credential Testing Report. The first few pages of the report show graphs and tables that provide a high-level breakdown of authenticated services and hosts. For a more detailed look at the compromised hosts, you

metasploit

can look at the Authenticated Services and Hosts Details section, which shows the services that were authenticated and the sessions that were opened on each host.

SSH Key Testing MetaModule

SSH public key authentication provides a secure method of logging in to a remote host. It uses an SSH key pair to authenticate a login instead of the traditional user name and password combination. The SSH key pair consists of a private and public SSH key. The private SSH key is stored on the local machine and enables you to log in to remote systems on which the corresponding public key is installed.

If you obtain an unencrypted SSH private key from a compromised target machine, you can run the SSH Key Testing MetaModule. This MetaModule enables you to bruteforce logins on a range of hosts to identify remote machines that can be authenticated with the private key. During the MetaModule run, Metasploit Pro displays real-time statistics for the number of hosts targeted, the number of login attempts made, and the number of successful logins. After the MetaModule completes its run, it generates a complete report that provides the details for the hosts it was able to successfully authenticate.

Running the SSH Key Testing MetaModule

Before you can run the SSH Key Testing MetaModule, you must either have a SSH private key available that you can upload to your project or your project must contain a looted SSH private key obtained from a scan, a bruteforce attack, or some other exploit method.

- 1. From within a project, select **Modules > MetaModules**.
- 2. Find the **SSH Key Testing** MetaModule and click the **Launch** button. The SSH Key Testing window appears.

3. From the **Scope** tab, enter the target address range you want to use for the test.

11. Click the Launch button.

When the MetaModule launches, the Findings window appears and displays the real-time statistics and tasks log for the MetaModule run. You can track the total number of hosts that the MetaModule attempted to authenticate, the total number of login attempts, and the total number of successful logins. If you want to view all the event details, you can click on the Task Log tab.

After the MetaModule completes its run, you should go the Reports area to view the SSH Key Testing Report. The first few pages of the report show graphs and tables that provide a high-level breakdown of cracked hosts and services. For a more detailed look at the hosts, you can look at the Authenticated Services and Hosts Details section, which shows the services that were authenticated and the sessions that were opened on each host.

Known Credentials Intrusion MetaModule

The Known Credentials Intrusion MetaModule logs in to a list of specified services and attempts to open sessions on a range of hosts with the known credentials in the project. You can run this MetaModule if you want to quickly get shells on the hosts in your project.

In order to run the Known Credentials Intrusion MetaModule, the project must already contain credentials that you have either collected from a Discovery Scan, bruteforce attack, or data import. The Known Credentials Intrusion MetaModule will attempt to authenticate to each service that has been enumerated for each host. If the MetaModule is able to successfully log in to the service, it attempts to open a session on the target, which you can use to do things like set up a VPN pivot, collect system data, or launch a shell to interact with the target system. It opens one session per target, and it will move onto the next host in the test if a session has already been established for a host.

During the MetaModule run, Metasploit Pro displays real-time statistics for the number of hosts targeted and the number of sessions opened. When the MetaModule completes its run, it generates a complete report that provides the details for the hosts on which it was able to open a session. You can share this report with your organization to expose weak passwords and to help mitigate vulnerabilities in its security infrastructure.

Running the Known Credentials Intrusion MetaModule

Before you can run the Known Credentials Intrusion MetaModule, you must run a Discovery Scan on the target network range or import existing host data. This populates the project with the necessary host information, such as open ports and services, that the MetaModule needs to run.

- 1. From within a project, select **Modules > MetaModules**.
- 2. Find the Known Credentials Intrusion MetaModule and click the **Launch** button. The Known Credentials Intrusion window appears.

MetaModules Categories:	SSH Key Testing Credentials	Single Password Testing Discovery Credentials	Pass the Hash Discovery Intrusion
Audding (1) Credentals (2) Discovery (4) Intrusion (2) Penetration Testing (2) Safety Rating: ★★★★★ (1)	This Metallodule attempts to log in to systems with a recovered SDH key and records the success and failure results for each service. You will need to apacify the seath service. You will need to apacify range of hosts that you want to test.	This MetaModule tests the usage level for a set of weak or exposed orderinitia. It tres to big in to a range of noise and services that you specify and records the secons and failure results for each service.	This MetaModule attempts to log in to as many hosts as possible with a recovered Window SAIM bash. It reports the hosts that it was able to successfully authenticate. You specify a username, SMB hashed password, and the range of hosts that you want to test.

a a b (0)	Passive Network Discovery Discovery Intrusion Auditing	Firewall Egress Testing Penetration Testing Discovery	Known Credentials Intrusion Penetration Testing
	This MetaModule snifts traffic to discover hosts and services on a local network. Since it does not send any pactets, you can run this app to conduct a steakity network discovery scan and dentify any hosts, services, and clear-text credentais.	This MetaModule runs a full Nmap SYN scan against an external server hosted by Rapi07 that cats as engress son trayet. Use this MetaModule to discover outbound ports on a freval that an attacker can use to extErtate information. You will need to specify the ports and protocols that you want to audit.	This MetaModule systematically logs in to as many hosts and services as possible using the known good credentials for this project. Run this MetaModule to reuse credentials that you have collected from compromised machines. For the best results, you should run a brutdence attack or phishing attack to collect as many credentials as you can before you run this MetaModule.
	Safety Rating:	Safety Rating:	Safety Rating:

3. From the **Scope** tab, enter the target address range you want to use for the test.

Known Credential Uses known credentials to obtained from bruteforce	Intrusion o compromise hosts av attacks, phishing attac	cross the entire network. You c cks, or exploited hosts.	an run this MetaModule to reuse cred	× entials that you
Scope	Address Range	10.6.201.0/24		
Payload				Advanced 8
Generate Report				
		Cancel Launch		

4. Click on the Payload tab to configure the payload settings.

Scope*	Payload Settings		
ayload	Payload type	Meterpreter	
	Connection	Auto 💌	
Generate Report	Listener Ports	1024-85535	
	Listener Host		

- 5. Specify the following settings that you want to use for the payload:
 - Payload type Choose Meterpreter for Windows or Command shell for Linux systems.
 - Connection Choose one of the following connection types:
 - Auto Automatically selects the payload type. In most cases, the Auto option selects the reverse shell payload because it is more likely to establish a connection between a target machine and the attacking machine.
 - Reverse Select this option if the targets are behind a firewall or use NAT. Typically, a reverse shell payload will work for most situations.
 - Bind Select this option if the target devices are unable to initiate a connection.
 - <u>Listener Ports</u> The port that you want the listener to listen on for incoming connections. By default, ports 1024-65535 are selected; however, you can define a specific port that you want the listener to use, such as 4444.
 - <u>Listener Host</u> The IP address that you want the target machine to connect back to. This is typically going to be the IP address of your local machine. If you do not specify a listener host, the MetaModule automatically uses the IP address of your local machine.

- 6. Click the Generate Report tab. The Report configuration form appears.
- 7. Enter a name for the report in the **Report Name** field, if you want to use a custom report name. Otherwise, the MetaModule uses the default report name.

Report is ena	bled
Report name	CredentialIntrusion_2013

8. Choose whether you want to generate the report as a PDF, HTML, or RTF file.

Report is enal	bled	PDF RTF HTML
Report name	CredentialIntrusion_2013	

From the Sections area, deselect any sections you do not want to include in the report. Skip this step if you want to generate all the report sections.

Sections	
🗹 Cover Page	Authenticated Services
Project Summary	and Hosts Details
Findings Summary	Options Selected
Authenticated Services and Hosts Summary Charts	

10. From the **Options** area, select the **Mask discovered passwords** option if you want to obscure any passwords that the report contains. The report replaces the password with **MASKED**. By default, this option is disabled. You should enable this option if you plan to distribute the report.

11. Select the **Email Report** option if you want to e-mail the report after it generates. If you enable this option, you need to supply a comma separated list of e-mail addresses.

If you want to e-mail a report, you must set up a local mail server or e-mail relay service for Metasploit Pro to use. To define your mail server settings, select **Administration > Global Settings > SMTP Settings**.

12. Click the Launch button.

Segmentation and Firewall Testing MetaModule

When firewalls have badly configured or lax egress traffic filtering policies, they open the network up to attacks from reverse shells, data-exfiltration, and other forms of exploitation. In order to identify the open ports that allow outbound traffic and to verify that your egress filtering policies properly block traffic, you can run the Segmentation and Firewall Testing MetaModule.

The MetaModule runs an Nmap SYN scan against an egress target to reveal the outbound ports that are open from an internal host. It identifies the state of the ports in your firewall based on the traffic received by the server. If the server receives the traffic, then the MetaModule flags the port as open. If the firewall blocks the traffic, the MetaModule flags the port as filtered. The MetaModule tags the remaining ports as unfiltered or closed depending on the their response to connections. After the MetaModule completes its run, it generates a report that provides you with a comprehensive look at port state distribution and unfiltered ports.

Egress Scan Target

The egress target, egadz.metasploit.com, is a server hosted by Rapid7 and has been set up to have all 65,535 ports open. Each port is configured to respond with a single SYN-ACK packet. In its default configuration, the MetaModule initiates a port scan using Nmap's default 1000 most common ports; however, if you need to include additional ports, you can define a custom port range.

Port States

The Segmentation and Firewall Testing MetaModule uses the following states to categorize ports.

- <u>Open</u>: A port is assigned an open state if it allows traffic out of the network and the EGADZ server receives it. An open state indicates that there is an application that is actively accepting TCP connections, UDP datagrams or SCTP associations.
- <u>Filtered</u>: A port is assigned a filtered state if it drops the traffic before it reaches the desired port on the EGADZ server. It will not receive a response from the EGADZ server. Typically, a port has a filtered state if a dedicated firewall device, router rules, or host-based firewall software has successfully blocked the port from sending traffic.
- <u>Closed</u>: A port is assigned a closed state if it allows traffic through the port, but there is not an application or service bound to the port. A closed port can be used to determine if t a host is up on an IP address.
- <u>Unfiltered</u>: A port is assigned an unfiltered traffic if it allows traffic through to the port, but it cannot be determined whether the port is open or closed.
Setting Up an Egress Testing Server

The Firewall Egress Testing MetaModule uses an external server hosted by Rapid7 to identify open outbound ports from an internal host. In some cases, you may want to set up and your own egress testing server. For example, if you want to test egress between different endpoints or if you do not want to send data to a server on the Internet, you can set up a custom egress testing server.

To help you set up a custom egress testing server, Metasploit Pro provides you with a script that you can run on an Ubuntu 12.04 LTS server. The script is downloadable from the Projects page in Metasploit Pro.

Egress Testing Server Requirements

To set up an egress testing server, you need to perform the following tasks:

- 1. Set up a Linux machine with your favorite distribution.
- 2. Add two network interfaces, or network adaptors, to the Linux machine. Each network interface should have an IP address.

For more information on setting up a network interface on a virtual machine, please visit the documentation for your virtualization software.

- 3. Assign one IP address as the administrative interface. This interface will be used to control the egress testing server. It should be assigned to the eth0 interface.
- 4. Assign the second IP address as the egress testing server. This interface should be assigned to the eth1 interface.
- 5. Download and run the egress testing server script.

Set Up a Custom Egress Target

To set up a custom egress target, you will need an Ubuntu 12.04 box that is configured with two IP addresses. The two IP addresses are needed for the following interfaces:

- <u>The admin interface</u>: This is usually found on the eth0 interface and will be used for controlling the egress server.
- <u>The egress server</u>: This is usually found on eth1, or a virtual interface such as eth0:1. This is the IP address you will scan from the Firewall and Segmentation Testing MetaModule.

After you set up the box with two addresses, perform the following steps:

- 1. Log in to the Metasploit Pro web interface.
- 2. Click the Segmentation Target Setup Script button located under the Global Tools.

The download process will automatically start.

If your browser is not configured to automatically download files, a dialog window will appear and prompt you to save the file. You will need to save the file to your computer.

- 3. Follow the instructions provided in the create-egadz.sh script to set up the egress target.
- 4. Verify that you are able to set up an egress target using the instructions.

After you have set up the egress target, you can run the Segmentation and Firewall Testing MetaModule.

Running the Segmentation and Firewall Testing MetaModule

- 1. From within a project, select **Modules > MetaModules**.
- 2. Find the Segmentation and Firewall Testing MetaModule and click the Launch button.

- 7. From the **Sections** area, deselect any sections you do not want to include in the report. Skip this step if you want to generate all the report sections.
- 8. Select the **Email Report** option if you want to e-mail the report after it generates. If you enable this option, you need to supply a comma separated list of e-mail addresses.

If you want to e-mail a report, you must set up a local mail server or e-mail relay service for Metasploit Pro to use. To define mail server settings, select **Administration > Global Settings > SMTP Settings**. 9. Click the Launch button.

Exporting Data

A data export enables you to routinely back up project data and create an archive of your tests. When you export data from a project, its contents are copied and saved to a file that can be imported into other projects or shared with other instances of Metasploit Pro. All exports can be downloaded from the Exports area of the web interface or from the exports directory.

Exports Directory

When Metasploit Pro generates an export, it stores a copy of the file in /path/to/Metasploit/apps/pro/exports. The files that are stored in this directory will match the list of exports displayed in the web interface.

You can go to the exports directory to download or view exported data; however, you should not make any changes directly to the default exports directory. If you need to modify the export files, you should make a copy the exports directory and make your changes from the new directory. Any changes that you make directly to the export files can cause disparities between the metadata that displays for the file in the web interface and the file itself.

If you need to remove exports from a project, you should do it from within the web interface. Do not delete them directly from the exports directory.

Viewing Exports Generated with Metasploit Pro 4.8 and Earlier

All exports generated with 4.8 and earlier are stored in /path/to/Metasploit/apps/pro/reports. These exports were created with an older version of Metasploit Pro and were not migrated to the exports directory that was added in Metasploit Pro 4.9. These files will not be listed or accessible from the web interface.

Export Logs

The export log maintains a historical record of all export-related events. Metasploit Pro automatically updates the export log each time you export data from a project. If you experience any issues with an export, you can view the export log to find stack trace errors and troubleshoot them.

Viewing the Export Log

You can find and view the export log in the following directory: /path/to/Metasploit/apps/pro/ui/log. The export log is named exports.log.

Clearing the Export Log

To clear the export log, you will need remove it from the log directory, which is located at /path/to/Metasploit/apps/pro/ui/log. Metasploit Pro will generate a new export log if it detects that one does not exist.

Note: Before you delete the export log, you should make a copy of it in case you need it for reference later.

Notification Center Statuses for Exports

The Notification Center alerts you when an export has started, finished, or encountered an error. The Notification Center appears as an icon in the upper-right corner of the global toolbar and turns green when there is an alert is available for you to review. You can click on the Notification Center icon to view a list of notifications for all projects.

M metasoloit"	Project - o	Project-demo ▼							Account - tdoan 🔻 Administration 🔻 🕯			
		Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Reports 2	Exports	Latest Notifications	Show All	^
Home demo Exports										Update Available Syst Update 2014030501 A	em .va 6 days ago	
Export creation	Export creation queued Notification Center updates						XML Export Generation complete.	5 minutes ago				
Saved Exports										XML Export		
C Delete R Fxnort Dat	8									Generating 5 minute	s ago	

The Notification Center displays the following statuses for exports:

- Export started This status indicates that the export has started.
- Export finished -This status indicates that the export has completed without errors and is ready for you to download. You can click on this alert to open the Exports page, which will list all of the export files that have been generated for the project. You can sort by the creation date to find the latest export file.
- Problem with export This status indicates that there was an issue with the export and it was not able to finish. You will need to view the export log to troubleshoot the issue. For more information on export logs, see *Export Logs* on page 256.

Export Types

Metasploit Pro offers the following export types:

- XML export An XML file that contains the attributes for most of the objects in a project and can be
 imported into another project. XML exports are particularly useful if you have a data set that you want
 to reuse in another project or share with another instance of Metasploit Pro. For example, you can
 export an XML of project data if you want to reuse the scan data from a particular project.
- Workspace ZIP A zip that contains an XML export and any loot files, report files, and tasks logs. This export type is useful if you want to back up the data and contents in a project or share the project with other instances of Metasploit Pro.
- **Replay script** A batch file that reruns tasks that opened sessions on target hosts. A replay script consists of multiple resource files (.rc). Metasploit Pro creates a resource file for each session it opens. You can run a replay script from the pro console or msfconsole.
- **PWDump** A text file that contains all of the credentials for a project, including plaintext passwords, SMB hashes, and SSH keys. Credentials can be masked to enumerate user names only.

XML Exports

When you export your project as an XML file, it contains most of the data that you see from the Analysis area of a project--with a few exceptions. The exported XML file contains most of the objects in a project's database and their attributes; it does not include any files that are associated with the objects in a project, such as task logs, generated reports, and loot files.

When you view the XML export file, you will see the following objects:

- Hosts Contains the details for each host in the project, including the following attributes: notes, tags, vulnerabilities, credentials, and sessions. It also include host details, such as the host ID, IP address, MAC address, host name, OS name, OS flavor, OS service pack, and purpose.
- Events Contains the event log for the project. Each event includes the workspace ID, event creation date, event name, and name of the user who launched the task.
- Sessions Contains the details for each session obtained in the project, including the following attributes: host ID, session type, module used, session description, port used, and session open/close dates.
- Services Contains the details for each service discovered in the project, including the service ID, host ID, port number, protocol type, state, service name, creation date, and modification date.
- **Credentials** Contains the details for each credential stored in the project, including the credential ID, service ID, user name, password, creation date, and modification date.
- Web sites Contains the details for each web server discovered, including the website ID, service ID, host address, VHOST address, HTTP port, creation date, and modification date.
- Web pages Contains the details for each web page discovered, including the web page ID, HTTP response code, VHOST address, web server address, HTTP port, content type, page content, creation date, and modification date.
- Web forms Contains the details for each web form discovered, including the web form ID, form path, request method, VHOST address, web server address, HTTP port, content type, page content, creation date, and modification date.

• Web vulnerabilities - Contains the details for each web vulnerability discovered, including the vulnerability category, vulnerability description, vulnerability confidence ranking, request method, vulnerability name, HTTP port, proof text, VHOST address, and vulnerability blame.

Note: Additional attributes may be available for each object; however, this list covers the most common attributes for each object.

Creating an XML Export of Project Data

- 1. Open the project from which you want to export data.
- 2. Select Exports > Export Data from the Project tab bar. The Export Data page appears.

	Project - demo 🔻						Accour	nt - tdoan 🔻 🛛 Ad	ministration 🔻	? 0
	Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Reports 2	Exports Ta	asks

🕵 Scan Import 🛛 N	lexpose 🧏 WebScan	🔒 Bruteforce	🛞 Exploit	🔘 Campaig	n 🗙 Stop a	ill tasks		Search)	٩

3. Select XML Export from the Export Format section.

Export Type				
Exp	oort type*	XML 🔻]	?

- 4. Replace the export file name with a custom name, if you do not want to use the default name. (Optional)
- 5. Define the hosts you want to explicitly include in the Included addresses field. (Optional)
- 6. Define the hosts you want to explicitly exclude in the Excluded addresses field. (Optional)
- 7. Select the **Mask credentials** option from the **Export Options** section if you do not want to include credentials in the export.

The credentials will be replaced with **MASKED** in the XML file. If you import the XML file into a project, the credentials will not be included.

8. Click the Export Data button.

When the export begins, you will be taken back to the Exports page. The Exports page displays an 'Export creation queued' message.

Home	demo Exports	>

	default-project- export.zip	Zip Workspace	tdoan	Complete	March 03, 2014 3:53 pm	Download						
Showi	ng 1 to 4 of 4 entries				First	Previous 1 Next Last						

The Notification Center icon will turn green and alert you when the export starts and completes. You can click on the Notification Center icon to view a list of system wide alerts. When the export completes, you can click on the notification message or you can select **Exports > Show Exports** from the Project tab bar to access the Exports area.

When the export is ready, it will listed be at the top of the Exports List. It will use the following naming convention: export-[current date and time]. If you do not see it at the top of the Exports List, click on the Create Date column name to sort the list by descending creation date.

If an error occurred during the export and the export was unable to complete, you can view the export log to identify and troubleshoot any errors that occurred. For more information on export logs, see *Export Logs* on page 256.

Workspace ZIP

A workspace ZIP contains an XML export, which details the attributes for most of the objects in a project, and any associated directories that contain loot files, report files, and tasks logs. You can export a workspace ZIP to make a copy of a project, its data, and its files. This is useful when you want to back up your findings or when you want to import the data into other projects.

When you export a project, Metasploit Pro generates a ZIP file that contains the following:

- Exported XML file Contains most of the objects in a project, including hosts, services, sessions, credentials, module details, and events.
- Reports directory Contains all of the generated reports for the project.
- Tasks directory Contains texts file that detail each task run.
- Loot directory Contains the loot files for the project, including hashes and SSH keys.

Generating a ZIP of the Project

- 1. Open the project from which you want to export replay scripts.
- 2. Select **Exports > Export Data** from the Project tab bar. The **Export Data** page appears.

	Project - demo 🔻						Accour	it - tdoan 🔻	Administration \mathbf{v}	? 0

Showi	ng 1 to 6 of 6 entries				First	evious 1 Next Last

The ZIP file will listed be at the top of the Exports List. It will use the following naming convention: export-[current date and time]. If you do not see it at the top of the Exports List, click on the Create Date column name to sort the list by descending creation date.

If an error occurred during the export and the export was unable to complete, you can view the export log to identify and troubleshoot any errors that occurred. For more information on export logs, see *Export Logs* on page 256.

Replay Scripts

A replay script is a batch file that reruns tasks that opened sessions on target hosts. You can export a replay script to automate successful attacks through the pro console or msfconsole. When you export a replay script, Metasploit Pro creates a resource file for each opened session and compresses them into a ZIP file.

Exporting Replay Scripts

- 1. Open the project from which you want to export replay scripts.
- 2. Select Exports > Export Data from the Project tab bar. The Export Data page appears.

	Project - demo 🔻						Accour	nt - tdoan 🔻	Administration $oldsymbol{v}$? 0
	Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Reports 2	Exports	Tasks	
								Show Export	ts	
Home demo Overview								Export Data		
🕵 Scan 🛛 Import 🛛 🛛	Nexpose 🏾 🍒 WebScan	Bruteforce	🛞 Exploit	🔕 Campaig	n 🗙 Stop a	all tasks		Sear	rc AD	Q,

3. Choose Replay Scripts from the Export Format section.

E	xport type*	Replay Scripts 🔹	?

- 4. Use the **Included addresses** to explicitly define the hosts you want to include in the replay scripts. (Optional)
- 5. Use the **Excluded addresses** to explicitly define the hosts you want to exclude from the replay scripts. (Optional)
- 6. If you do not want to include credentials in the export, select the **Mask credentials** option from the **Export Options** section.
- 7. Click the Export Data button.

When the export begins, you will be taken back to the Exports page. The Exports page displays an "Export creation queued" message.

The Notification Center icon will turn green and alert you when the export starts and completes. You can click on the Notification Center icon to view a list of system wide alerts. When the export completes, you can click on the notification message or you can select **Exports > Show Exports** from the Project tab bar to access the Exports area.

The ZIP file will listed be at the top of the Exports List. It will use the following naming convention: export-[current date and time]. If you do not see it at the top of the Exports List, click on the Create Date column name to sort the list by descending creation date.

If an error occurred during the export and the export was unable to complete, you can view the export log to identify and troubleshoot any errors that occurred. For more information on export logs, see *Export Logs* on page 256.

Running the Replay Script with the Pro Console or MSFConsole

To run the replay script, you need to use the resource command. It loads the batch files and run them through the pro console or msfconsole. The resource command needs to include the path to the replay script. For example, you can enter resource /path/to/session_ID_IP.rc to load the replay script and run the commands stored in the file.

Before you can run the resource file, you will need to extract them from the ZIP file.

PWDumps

A PWDump is a text file that contains all of the credentials for a project, including plaintext passwords, SMB hashes, and SSH keys. You can export a PWDump file to perform offline password cracking with a tool like John the Ripper.

Exporting a PWDump

- 1. Open the project from which you want to export data.
- 2. Select Exports > Export Data from the Project tab bar. The Export Data page appears.

	Project - demo 🔻						Accour	nt - tdoan 🔻	Administration $ extbf{v}$? 0
pro	Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Reports 2	Exports	Tasks	
								Show Exports		
Home demo Overview								Export Data		
📡 Scan 🗐 Import 🛛 N	lexpose 🧏 WebScan	🚹 Bruteforce	🛞 Exploit	Campaig	n 🗙 Stop a	all tasks		Searc	dh.	Q

3. Select PWDump from the Export Format section.

ſ	Export Type			
		Export type*	Password Dump 🔹	?

- 4. Use the Included addresses to explicitly define the hosts you want to include in the export. (Optional)
- 5. Use the **Excluded addresses** to explicitly define the hosts you want to exclude from the export. (Optional)
- 6. Click the Export Data button.
- 7. When the export begins, you will be taken back to the Exports page.

The Notification Center icon will turn green and alert you when the export starts and completes. You can click on the Notification Center icon to view a list of system wide alerts. When the export completes, you can click on the notification message or you can select **Exports > Show Exports** from the Project tab bar to access the Exports area.

The PWDump will listed be at the top of the Exports List. It will use the following naming convention: export-[current date and time]. If you do not see it at the top of the Exports List, click on the Create Date column name to sort the list by descending creation date.

If an error occurred during the export and the export was unable to complete, you can view the export log to identify and troubleshoot any errors that occurred. For more information on export logs, see *Export Logs* on page 256.

Viewing Exported Data

To see a list of exported data, select **Exports > Show Exports** from the Project tab bar. The Data Exports list will display all exports associated with the project. You can click on the **Download** or **View** link to access each item.

Social Engineering

Social engineering is an attack method that typically uses a delivery tool, like e-mail, a web page, or a USB key, to induce a target to share sensitive information or perform an action that enables an attacker to compromise the system. You perform social engineering tests to gauge how well the members of an organization adhere to security policies and to identify the security vulnerabilities created by people and processes in an organization.

The data you gather from a social engineering campaign can help paint a clearer picture of the risks and vulnerabilities that exist in an organization's security infrastructure and policies. An organization can leverage the test results to strengthen their security policies, increase IT defense mechanisms and improve the effectiveness of their security training program.

In Metasploit Pro, you create and run campaigns to perform social engineering attacks. A campaign is a logical grouping of the campaign components that you need to exploit or phish a group of people. You can create a campaign using the following components:

- E-mail, web page, and portable file: The delivery mechanism for a social engineering attack.
- <u>Template</u>: A reusable HTML shell that contains boilerplate can be shared between campaigns in a project. You can create and use a template to quickly generate web page or e-mail content for a campaign.
- Target list A list that defines the recipients and their e-mail addresses that will receive an e-mail.

Social Engineering Techniques

The main goal of social engineering is to entice a target to perform some illicit action that enables you to either exploit their system or to collect information from them.

Social engineering typically uses e-mail based attacks that target client-side vulnerabilities, which are exploitable through vectors that only a local user can reach. These attacks usually leverage file format exploits and client-side exploits to target the applications and information stored on a victim's local machine or phishing scams to gather information from a human target. For example, you can attach a PDF that contains an exploit, like the Cooltype exploit, to an e-mail and send the e-mail to a group of people. When a recipient opens the infected PDF, it can create a session on their machine if it is vulnerable to the Cooltype exploit.

The method that you choose depends on the intent and purpose of the social engineering attack. For example, if you want to see how well an organization handles solicitation e-mails, you can set up a phishing attack. If you want to gauge how well an organization follows security best practices, you can

generate a standalone executable file, load it onto a USB key, and perform a USB key drop. Some of the most common social engineering methods are listed below.

Phishing

Phishing is a social engineering technique that attempts to acquire sensitive information, such as user names, passwords, and credit card information, from a human target. During a phishing attack, a human target receives a bogus e-mail disguised as an authentic e-mail from a trusted source, like a financial institution. The e-mail contains a link to open a fake web page that looks nearly identical to the official site. The style, logo, and images may appear exactly as they are on the real website. If the phishing attack is successful, the human target will fill out the web form and provide sensitive data that you can use to further compromise their system.

To set up a phishing attack in Metasploit Pro, you need to create a campaign that contains the following components:

- <u>E-mail component</u>: Defines the content that you want to send in the e-mail body, and the human targets that you want to receive the phishing attack. Each campaign can only contain one e-mail component.
- <u>Web page component</u>: Defines the web page path, the HTML content, and the redirect URL. The web page that you create must contain a form that a human target can use to submit information.

Client-Side Exploits

A client-side exploit attacks vulnerabilities in client software, such as web browsers, e-mail applications, and media players. In a client-side exploit, the victim must visit a malicious site in order for the exploit to run. A client-side exploit is different from a traditional exploit because it requires the victim to initiate the connection between their machine and an attacking machine. Traditional exploits, on the other hand, do not require human interaction.

When a human target visits the web page that contains the exploit, a session opens on the target's machine and gives you shell access to the target's system if the target's system is vulnerable to the exploit. Using the session, you can do things like capture screenshots, collect password files, and pivot to other areas of the network.

To set up a file format or client-side exploit in Metasploit Pro, you need to create a campaign that contains the following components:

- <u>E-mail component</u>: Defines the content that you want to send in the e-mail body and the human targets that you want to receive the e-mail. You can provide a link to the web page that serves the exploit.
- Web page component (optional): Sets the web page component to send a client-side exploit and defines the tracking URL, and the HTML content for the web page.

File Format Exploits

File format exploits are attacks that take advantage of a vulnerability in the way that an application processes data in a particular kind of file format, such as PDF, DOC, or JPEG. A file format exploit can run when a human target opens a attachment that contains the exploit. For example, you can attach a malicious Word document that contains an exploit, like MS11-006, to an e-mail. When the human target downloads and views the attachment (in thumbnail view), a session opens on the target's machine and gives you a shell to access their system.

To set up an e-mail attachment attack in Metasploit Pro, you need to create a campaign that contains the following components:

- <u>E-mail component</u>: Attaches a file format exploit to the e-mail and defines the content that you want to send in the e-mail body, and the human targets that you want to receive the e-mail.
- <u>Portable file component</u>: Generates a file format exploit that you can store on a USB key.

Java Signed Applets

The Java Signed Applet Social Engineering Code Execution module creates a jar file and signs it. You deliver the Java signed applet to a human target from a web page that contains an applet tag. When a human target visits the web page, the target's Java Virtual Machine asks the human target if they trust the signed applet. If the human target runs the applet, it creates a session on the victim's machine and gives you full user permissions to their system.

Portable Files

A portable file can be used for a USB drive drop. A portable file can be a generated executable file or a file format exploit that you load onto a USB key. When a human target installs the USB drive and opens the file, a connection is created from the target's machine to the attacking machine.

To create a portable file in Metasploit Pro, you need to create a campaign that contains the following component:

<u>Portable file component</u> - Generates an executable or file format exploit that you can store on a USB key.

Social Engineering Terminology

Before you start building campaigns, you should familiarize yourself with the following terms.

Campaign

A campaign is a logical grouping of components that you need to perform a social engineering attack. A campaign can contain only contain one e-mail component, but can have multiple web pages or portable files.

Click Tracking

Click tracking is a method of client-side testing that tracks the number of human targets that click on a link. The web page tracks the number of visits and helps an organization identify how susceptible members of their organization are susceptible to social engineering attacks.

E-mail Template

An e-mail template contains predefined HTML content that you can insert into an e-mail.

Executable

An executable file that automatically runs when a human target opens the file. The executable runs a payload that creates a connection from the exploited machine back to the attacking machine.

File Format Exploit

A file format exploit targets a vulnerability in a specific application, such as Microsoft Word or Adobe PDF.

Human Target

A human target is the person who receives the social engineering attack or is part of a campaign.

Phishing Attack

A phishing attack is a form of social engineering that attempts to acquire sensitive information, such as user names, passwords, and credit card information, from a human target. During a phishing attack, a human target receives a bogus e-mail disguised as an authentic e-mail from a trusted source, like the bank. Generally, the e-mail contains a link that opens a fake web page that looks nearly identical to the official site. The style, logo, and other images may appear exactly as they are on the real website.

Portable File

A generated executable file that you can attach to an e-mail or save to a USB key. When the victim opens the file, the executable runs the payload, starts a session on the victim's machine, and connects back to

your machine.

Resource File

A resource file refers to a web page template, e-mail template, or target list. It is a reusable file that you can use in a campaign. Each project has its own set of resource files. The resource files are not shareable between projects.

Target List

A target list defines the targets that you want to include in the social engineering campaign. You use the target list to specify the recipients that you want to e-mail the social engineering attack.

Tracking GIF

A tracking GIF sets a browser cookie when a human target opens an e-mail.

Tracking Link

A tracking link consists of a URL path to a web page and a tracking string. When a target clicks on the URL, the system sets a cookie to track the visit and any subsequent visits.

Tracking String

A tracking string is a 64 bit string that encodes the target and e-mail IDs. Campaigns use tracking strings to monitor the activity of a target.

Visit

A visit occurs when a target clicks on a link and opens the web page.

Web Template

An web template contains predefined HTML content that you can insert into a web page.

Managing Campaigns

In Metasploit Pro, you create and run campaigns to perform social engineering attacks. A campaign contains the e-mails, web pages, and portable files that are necessary to run a social engineering attack against a group of targets. You can set up campaigns to perform phishing attacks, launch client-side exploits, run Java signed applets, generate executables for USB key drops, and send out e-mails with malicious attachments.

The campaign tracks the number of human targets that fall victim to the attack and presents the results in a social engineering report. You can read the report to review the metrics for the campaign, learn about remediation recommendations, and determine the effectiveness of the campaign. Additionally, the campaign page shows real-time statistics that provide you with a high-level overview of the campaign results. For example, you can view the number of recipients who opened the e-mail or filled out the web form in a phishing campaign.

A campaign is a logical grouping of the campaign components that you need to exploit or phish a group of people. A campaign can be comprised of the following campaign components: e-mail, web page, or portable file. The components that you add to the campaign depend on the purpose and goal of the social engineering attack.

Campaign Restrictions

The following restrictions apply to campaigns:

- A campaign can only contain one e-mail.
- A campaign that you build with the canned phishing campaign can only contain one e-mail and up to two web pages. One web page is used for the landing page, and the other web page is used for the redirect page. If you need additional redirect pages, do not use the canned phishing campaign to create a campaign, use the custom campaign builder instead.
- Each instance of Metasploit Pro can only run one campaign at a time.

Campaign Dashboard

The Campaign Dashboard contains the interfaces and tools that you need to set up social engineering campaigns. It provides you with access to the campaigns, target lists, and resource files that are in a project. The Campaign Dashboard is made up of the campaign tasks bar, modal windows, campaign widgets, and action links.

Campaign Tasks Bar

When you access the Campaign Dashboard, you will see the Campaign Tasks bar below the main Tasks bar. Each tab in the Campaign Tasks bar represents a major section of functionality within social engineering. Click on the tabs to switch to between the campaign configuration, campaign management, and campaign elements areas.

™ metasploit®	Project -	Phishing V	— 1					A	ccount - thao 🔻	Administration 🔻 💡

Campaign: U	JSB		1 🎓			Start				Launchable
Started: not starte	ed	Update	d: March 30, 201	13 at 8:46 PM						Edit Delete

The Campaign Tasks bar contains the following tabs:

- **Configure a Campaign** Displays the campaign editor. Use the campaign editor to create new campaigns and edit existing campaigns.
- Manage Campaigns Shows a list of campaigns that are currently in the project. Next to each campaign listing is a set of action links. Use these action links to edit, delete, reset, preview, and start/stop a campaign.
- Manage Reusable Resources- Provides a management interface for reusable campaign resources, such as e-mail templates, web page templates, target lists, and malicious files.

Campaign Widgets

A campaign widget is an icon that represents a campaign component. When you click on the campaign widget, it opens a modal window that displays the configuration form for that campaign component.

Campaign Components		
Click on a component to open its configuration page	E-mail Lan	D ding Page
Server Configurations		
Click on a server to open its configuration page	E-mail Server We	eb Server

Modal Windows

A modal window is a small pop-up window that requires you to interact with it before you can go back to the main window. Typically, modal windows are used to display alerts and confirmation windows. In Metasploit Pro, modal windows guide you through the process of setting up campaign components.

To exit a modal window, you must either complete the required form data, or you can click the 'X' to exit the screen.

	After form submission, redirect to URL:	
	http://example.com/landing	
	Campaign Redirect Page	

Action Links

An action link is an interactive link that you can click on to perform a specific task. Each campaign has a set of action links that are available for you to use.

The following action links are available to each campaign:

- Start Launch the campaign.
- Stop Stop the campaign.
- Preview Generate a preview of an e-mail and web page.
- Reset Reset the statistics and data in a campaign.
- Edit Edit the current configuration for campaign components.
- Delete Remove the campaign and its data from the project.

The following image shows the action links that are available for a campaign:

Campaign States

The state describes the current status of a campaign. At any given point in time, a campaign can be in one of the following states:

- <u>Unconfigured</u> The campaign does not contain any components or contains components that have not been configured.
- Preparing The campaign is getting ready to run.
- Launchable The campaign is ready to be launched.
- Running- The campaign is online.

For campaigns that have a web page, this means that the web page is online and accessible to target machines that can reach the Metasploit instance.

For campaigns that contain an e-mail, this means that Metasploit Pro has attempted to send the email to the target list through your mail server.

For campaigns that contain portable files, this means that handler is ready and waiting for incoming connections from target machines.

• Finished- The campaign is no longer active.

For campaigns that have a web page, this means that the web page is no longer accessible and cannot be viewed by anyone.

For campaigns that contain portable files, this means that the handler is no longer listening for incoming connections.

Creating a Campaign

- 1. From within a project, select Campaigns from the Tasks menu.
- 2. When the Manage Campaigns area appears, click the Configure a Campaign tab.
- 3. When the Configure a Campaign area appears, enter a name for the campaign in the **Name** field.
- 4. Choose one of the following setup options:

- **Phishing Campaign** Metasploit Pro automatically creates a campaign that has the necessary campaign components for a phishing attack. The phishing campaign contains an e-mail component and two web page components that you configure to set up the landing page and the redirect page.
- Custom Campaign You manually create the campaign and add the campaign components that you need to it. For example, if you need to generate a portable file or generate a file format exploit.

Now you're ready to customize the campaign. If the campaign is empty, you will need to add a component to it. For example, if you want to generate an executable to save to a USB key, you can add a portable file component.

Editing the Campaign Name

- 1. From within a project, select **Campaigns** from the Tasks menu.
- 2. When the Manage Campaigns area appears, find the campaign that you want to edit.
- 3. Click the Edit link.
- 4. When the campaign configuration page appears, delete the existing campaign name from the **Name** field.
- 5. Enter the new campaign name in the Name field.
- 6. Click the Save button.

Running a Campaign

- 1. From within a project, click the Campaigns tab.
- When the Manage Campaigns area appears, find the campaign that you want to run. The campaign status must be launchable for the campaign to run. A launchable status indicates that all necessary components of the campaign are configured.
- 3. Click the Start link.

Clearing the Data from a Campaign

When you reset the campaign, you clear all the statistics and data collected by the campaign. A campaign reset removes any data collected through form submissions, the statistics for a phishing attack, and the statistics for e-mail tracking.

1. From within a project, select **Campaigns** from the Tasks menu.

2. When the Manage Campaigns area appears, find the campaign that you want to reset.

4. When the confirmation window appears, click **OK** to confirm that you want to reset the data in the campaign.

Viewing the Findings for a Campaign

- 1. From within a project, click the **Campaigns** tab.
- 2. When the Manage Campaigns area appears, find the campaign whose results you want to view.
- 3. Click the **Findings** link. The **Findings** window appears and displays the statistics for the entire campaign. You will see the total number human targets that received an e-mail, opened the e-mail, visited the phishing web page, and submitted the web page form.
- 4. Click on a stat bubble to view the findings for that a list of human targets associated with that statistic.

For example, if you view the findings for the recipients who filled out the web form, you will see the name and e-mail of the human target that submitted the web form. If you click on their e-mail address, you will see the data that they submitted.

5. Click the **Done** button to close the **Findings** window.

Adding a Campaign Component

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that you want to edit and click the **Edit** link.

Home 📄 My First Metasploit Project 📄 Campaig	gns

3. When the campaign configuration page appears, click the **Add e-mail, web page, or portable file** button. You can only add components to a campaign that uses the custom setup. You cannot add components to a campaign that you created with the canned phishing campaign.

Campaign Components	
Click on a component to open its configuration page	Add.email.web.page, portable file

4. Click on the campaign component that you want to add. After you add the component, the configuration page for the component appears. Follow the onscreen instructions to configure the component.

Campaign Components			
Click on a component to open its configuration page			
		Add email, web page, portable file	
	Email	Web Page	Portable File

Removing a Campaign Component

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that you want to edit and click the **Edit** link.
- 3. When the campaign configuration page appears, click the **Edit** button located under Campaign Components. The component icons show red X's that you can use to remove a component from the campaign.
- 4. Click the 'X' button for the component that you want to remove.
- 5. Click the Done button when you finish.

Stopping a Campaign

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that you want to stop.
- 3. Click the Stop link.

Sending an E-mail Notification when a Campaign Starts

Before you configure an e-mail notification, you should verify that the SMTP settings for your mail server have been configured for Metasploit Pro. Go to **Administration > Global Settings** to view your SMTP settings.

- 1. From the campaign configuration form, locate the Notifications area.
- 2. Select the Notify others before launching the campaign option.
- 3. When the Notification Settings window appears, enter the e-mail addresses of the people who you want to send the alert in the To field. To include multiple e-mail addresses, use a comma separated list of e-mail addresses. For example, you can enter a list like the following: joe@rapid7.com, mary@rapid7.com, jon@rapid7.com.
- 4. In the **Subject** field, enter the subject that you want the e-mail to display. By default, Metasploit Pro auto-fills the subject for you with a canned subject line.
- 5. In the **Message** field, enter the information, or body, that you want to send in the e-mail. For example, you may want to say something like, "This is a company wide alert to inform you that we are starting our security awareness program. If you have any questions, please contact John Smith."
- 6. When you are done creating the notification e-mail, click the **Save** button.

Uploading a Malicious File

- 1. From within a project, click the Campaigns tab.
- 2. Click the Manage Reusable Resources tab.
- 3. From the **Resource** dropdown, select **Malicious Files**.
- 4. Click the New Malicious File button.
- 5. In the **File name** field, enter the name of the file that you are importing. The file name must include the file extension. For example, if you are uploading an executable file, the file name should include the exe extension.
- 6. Click the **Browse** button to navigate to the location of the file that you want to upload. Once you have found and selected the file, click the **Open** button. The path to the file will appear in the Attachment field.
- 7. Click the Save button.

Deleting a Campaign

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that you want to delete.
- 3. Click the **Delete** button.
- 4. When the confirmation window appears, click **OK** to confirm that you want to permanently delete the campaign. All target lists and campaign components will be deleted from the project. You will no longer be able to view, run, or edit the campaign.

Exporting a CSV File of Campaign Findings

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that contains the data that you want to export.
- 3. Click the Findings link.
- 4. Click on the stat bubble that represents the data that you want to export. For example, if you want to export the list of human targets that opened the e-mail, click on the n% recipients opened the e-mail stat bubble. A list of human targets and the Export Data button appears.
- 5. Click the Export Data button.
- 6. When the Open window appears, choose the **Save File** option and click **OK**. The file saves to the Downloads folder on your system.

Exporting a CSV File of E-mail Sent from a Campaign

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that contains the data that you want to export.
- 3. Click the **Findings** link.
- 4. Click on the **#n e-mails were sent** stat bubble. A list of human targets and the Export Data button appears.
- 5. Click the Export Data button.
- 6. When the Open window appears, choose the **Save File** option and click **OK**. The file saves to the Downloads folder on your system.

Exporting a CSV File of Human Targets that Opened the E-mail

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that contains the data that you want to export.
- 3. Click the Findings link.
- 4. Click on the **%n of recipients opened the e-mail** stat bubble. A list of human targets and the Export Data button appears.
- 5. Click the Export Data button.
- 6. When the Open window appears, choose the **Save File** option and click **OK**. The file saves to the Downloads folder on your system.

Exporting a CSV File of Human Targets that Clicked on the Link

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that contains the data that you want to export.
- 3. Click the Findings link.
- 4. Click on the **%n of openers clicked on link**stat bubble. A list of human targets and the Export Data button appears.
- 5. Click the Export Data button.
- 6. When the Open window appears, choose the **Save File** option and click **OK**. The file saves to the Downloads folder on your system.

Exporting a CSV File of Human Targets that Submitted the Form

- 1. From within a project, click the Campaigns tab.
- 2. When the Manage Campaigns area appears, find the campaign that contains the data that you want to export.
- 3. Click the **Findings** link.
- 4. Click on the **%n of openers submitted the form** stat bubble. A list of human targets and the Export Data button appears.
- 5. Click the **Export Data** button.
- 6. When the Open window appears, choose the **Save File** option and click **OK**. The file saves to the Downloads folder on your system.

Modifying the SSL Cipher for Web Servers

A cipher suite is collection of cryptographic algorithms that are needed to secure a network connection through SSL. The cipher string indicates the collection of cipher suites that your web server uses. By default, the web server for each campaign uses the following cipher string:

EECDH+AESGCM:EDH+AESGCM:ECDHE-RSA-AES128-GCM-SHA256:AES256+EECDH:DHE-RSA-AES128-GCM-SHA256:AES256+EDH:ECDHE-RSA-AES256-GCM-SHA384:DHE-RSA-AES256-GCM-SHA384:ECDHE-RSA-AES256-SHA384:ECDHE-RSA-AES128-SHA256:ECDHE-RSA-AES256-SHA:ECDHE-RSA-AES128-SHA:DHE-RSA-AES256-SHA256:DHE-RSA-AES128-SHA256:DHE-RSA-AES256-SHA:DHE-RSA-AES128-SHA256:DHE-RSA-DES-CBC3-SHA:EDH-RSA-DES-CBC3-SHA:AES256-GCM-SHA384:AES128-GCM-SHA256:AES256-SHA256:AES128-SHA256:AES256-SHA:AES128-SHA:ECDHE-RSA-DES-CBC3-SHA:EDH-RSA-DES-CBC3-SHA:AES256-GCM-SHA384:AES128-GCM-SHA256:AES256-SHA256:AES128-SHA256:AES256-SHA:AES128-SHA:DES-CBC3-SHA:HIGH:!aNULL:!eNULL:!EXPORT:!DES:!MD5:!PSK:!RC4

The default cipher string provides reasonable security, is accepted by modern browsers, but also works with IE 8 and Windows XP. The string provides the best possible encryption for all browsers and SSL clients. It disables any ciphers (!aNULL) that do not require authentication and the following ciphers: RC4, PSK, MD5, and DES.

To strengthen the SSL configuration for your web server even further, you can modify the default cipher string that is provided. For example, you may want to disable a particular cipher. You can disable a cipher by prepending it with an exclamation point and separating each cipher with a colon. For example, to disable DSS, you can append : ! DSS to the cipher string.

To modify the SSL cipher string:

- 1. From within a project, select **Campaigns**.
- 2. When the Campaigns page appears, go to the **Configure a Campaign** tab to create a new campaign or go to the **Manage Campaigns** tab to choose an existing campaign.

3. From the campaign configuration form, click the **Web Server** icon.

Configure a Campaign Create or edit a campaign		Manage Campaigns View existing campaigns and campaign findings	Manage Reusable Resources Manage and create templates and target lists		
	Name*	Demo			
		Phishing Campaign O Custom Campaign			
impaign Components					
ck on a component to open its configuration page		Email			
erver Configurations					
ick on a server to open its configuration page		Email Server Web Server			

4. When the web server configuration window appears, find the SSL cipher specification option.

Configure Web Server	
Web host*	This server's IP address: 10.20.44.51 This server's IP address: 10.20.44.51
	Inis server's hostname: nightly-demo-ub1204-b4 Alternate hostname or IP (must resolve to 10 20.44.51):
Listening Port	8080 Serve over SSL
SSL cipher specification	EECDH+AESGCM:EDH+AESGCM:ECDHE-RSA-AES128-GCM-SHA256:AES256+EE
Custom SSL Cert	Choose File No file chosen

5. Replace the default cipher string with the one you want to use.

If you leave the field blank, the server will use the following cipher, which does not include SSLv2 or export grade ciphers (e.g., 40 bit), but includes RC4 and low security ciphers:

ALL: !ADH: !EXPORT: !SSLv2:RC4+RSA: +HIGH: +MEDIUM: +LOW

6. Save your changes when you are done.

Uploading Custom SSL Certificates

Using SSL is one way that you can gain trust from a site visitor. SSL authenticates and verifies the identity of the site that the visitor is trying to access, and it encrypts any data exchanged with the site. This just simply means that a secure link has been established for the session and the visitor can trust the data transmitted by the site. All secure sessions use an SSL certificate, which is usually digitally signed by a trusted authority and used to let a web browser know that the identity of the domain has been validated.

When you build a social engineering campaign, you can configure the web server to use SSL. If SSL is enabled, the Metasploit web server uses a self-signed certificate, which unfortunately, shows up in the browser as being untrusted. To make your web page appear to come from a trusted source, you will need to use a valid SSL certificate instead of the self-signed Metasploit certificate.

You can obtain an SSL certificate from a certification authority (CA). Please make sure that it is an X.509 certificate that has a .pem file extension.

When you configure the web server for a social engineering campaign, there is an option to upload a custom SSL certificate. You simply need to enable the **Serve over SSL** option and upload the SSL certificate you want the server to use, as shown below:

Configure Web Server	
Web host*	This server's IP address: 10.20.44.51
	This server's hostname: nightly-demo-ub1204-64
	Alternate hostname or IP (must resolve to 10.20.44.51):
Listening Port	8080
Custom SSL Cert	Serve over SSL Choose File test_cert.pem

To upload and use a custom SSL certificate:

- 1. From within a project, select Campaigns.
- 2. When the Campaigns page appears, go to the **Configure a Campaign** tab to create a new campaign or go to the **Manage Campaigns** tab to choose an existing campaign.
- 3. From the campaign configuration form, click the Web Server icon.

4. From the Configure Web Server form, enable the Serve over SSL option.

Configure Web Server	
Web host*	This server's IP address: 10.20.44.51 This server's locateness plathly done util 10.4.64
	Inits server's hostname. Inging-demodul (204-04 Alternate hostname or IP (must resolve to 10.20.44.51):
Listening Port	8080
Custom SEL Cart	Serve over SSL

5. Click the **Choose File** button next to the **Custom SSL Cert** option.

Configure Web Server	
Web host*	This server's IP address: 10.20.44.51
	This server's hostname: nightly-demo-ub1204-64
	Alternate hostname or IP (must resolve to 10.20.44.51):
Listening Port	0808
	✓ Serve over SSL
Custom SSL Cert	Choose File No file chosen

- 6. Browse to the location of the X.509 certificate and select it.
- 7. Click **Save** to close the web server configuration page.

To test the certificate, you will need to launch the campaign and go to the URL you set up for the web page. The URL will look something like this: https://10.20.44.51:8080/landing. When the web page appears, verify that the SSL certificate that appears is the one that you uploaded.

If you do not know the URL for the web page, do not launch the campaign yet. You will need to find the web page's name, URL path, and the web server's listening port.

The first thing you need to do is go to the web page's settings to view its URL path. To access the web page's settings, click on the **Web Page** icon located on the campaign configuration page. The Configure Web Page Settings form appears, as shown below:

Configure Web Page Settings		1 Settings	2 Content	
Path*	http://10.20.44.51/ lan	nding		
Component name*	Web Page			
Attack type*	None			٧

The **Path** field shows the name and path that you assigned to the web page. Now that you know the path and name, you need to go to the web server's settings to find its listening port. To access the web server's settings, click on the **Web Server** icon located on the campaign configuration page.

Web host*	This server's IP address: 10.20.44.51	
	This server's hostname: nightly-demo-ub1204-64	
	Alternate hostname or IP (must resolve to 10.20.44.51):	
Listening Port	8080	
	✓ Serve over SSL	
Last uploaded cert:	test_cert.pem	
Custom SSL Cert	Choose File No file chosen	

Now that you have the web page name, path, and web server port, you can figure out the URL that you can use to test the web page. The resulting URL will be something like https://l0.20.44.51:8080/landing.

Best Practices for Social Engineering

Social engineering is an attack method that induces a person to unknowingly divulge confidential data or to perform an action that enables you to compromise their system. Typically, social engineering attacks utilize delivery-based methods, such as e-mail and USB keys, but they can also use other mechanisms, such as phone calls and onsite visits. Social engineering attacks are becoming more prevalent in the existing security landscape and are forcing many organizations to take a closer look at one of their most vulnerable targets: their employees.

As part of a penetration testing engagement or a security awareness program, you may be asked to perform social engineering tests to audit the organization's physical and IT security infrastructure.

Before you can execute any type of social engineering test, you need to clearly define the objectives of the engagement and to explicitly identify the goals that the organization wishes to achieve. Most organizations will want to measure the effectiveness of their security training program or identify the weaknesses in their existing security policies and IT defense mechanisms. Once you have a clear understanding of the purpose of the assessment, you can build an attack plan that addresses all the areas of concern.

Generally, there are two distinct forms of social engineering penetration tests: digital and physical tests. A digital social engineering test focuses more on IT security and policy compliance whereas a physical social engineering test deals more with human behavior and tangible assets, like office spaces and company equipment. Depending on the goals of the engagement, you may utilize only one style of testing or you may incorporate both types.

For example, if the organization wants to identify the metrics for employee security policy compliance, you may need to build a long-term plan that establishes an initial baseline before any social engineering attacks

even take place. Once you have determined the baseline, you can implement social engineering attacks, like USB key drops and phishing scams, that test both the physical security perimeter as well as the protection of digital data.

Social Engineering with Metasploit Pro

Metasploit Pro's social engineering feature mainly focuses on computer-based attacks. Most computerbased social engineering attacks utilize a delivery mechanism, like e-mail, to send links to a spoofed website or attachments that contain a malicious file. With Metasploit Pro, you can create and distribute the necessary e-mails and files that are typically associated with digital attacks.

In Metasploit Pro, a social engineering penetration test is performed through a campaign. A campaign is the workspace that you use to manage and execute all social engineering related tasks. Additionally, a campaign tracks test findings and stores the resource files that you need to create social engineering attacks, such as web page templates, e-mail templates, malicious executables, and target lists.

To understand how social engineering works with Metasploit Pro, let's go over the most common types of social engineering attacks and the processes that you will use to implement them. Along the way, we will provide you with some best practice tips that will help you set up effective and useful social engineering tests.

Phishing

If you look in your SPAM folder, you will undoubtedly find phishing e-mails that have been perfectly crafted to look like they are from your bank, your friends in Nigeria, or pretty much anyone with whom you would share your most confidential information. These e-mails may look nearly identical to the real e-mails, or they may be terrible recreations of the original. Regardless, their purpose is to trick the reader into believing in their authenticity. The e-mail may contain header information, like the sender's e-mail address, that looks absolutely legitimate. The e-mail may also contain headers, footers, and logos that are near identical matches to the real ones.
Hey John, Your password is about to expire. Please visit Netsuite to update your account. Use this link to access your account directly. Thanks, IT **RAPIDT**

Ultimately, the goal is to get the reader to click on a link provided in the e-mail. The link directs them to a spoofed site that is set up to steal data and use the stolen information for nefarious purposes.

This is where Metasploit Pro comes into the picture. One of the major capabilities of the Metasploit Pro social engineering feature is the ability to easily create and send phishing e-mails. From within Metasploit Pro, you can create and set up the components that you need to run a phishing attack - including the phishing e-mail, spoofed website, mail server settings, and target list.

Now that you have a general overview of how phishing attacks work, and how Metasploit Pro helps you phish people, let's go over some tips that will help you set up successful phishing attacks.

Phishing Tip #1: Clone, clone, clone.

One of the most useful capabilities of the social engineering feature is the ability to clone a real, live web page. To clone a web page, you simply need to provide Metasploit Pro with the URL. Metasploit Pro makes a copy of the web page's HTML and imports it into the campaign. After the HTML has been imported, you can tweak the code to further customize or perfect the page.

Since the purpose of a spoofed web page is to trick a human target into believing in its authenticity, it is absolutely vital that the spoofed web page be a near replica of the real one. Therefore, unless you are creating a unique web page for the purposes of the campaign, you should always clone an existing web page. When you clone an existing web page, resources files, such as images, will be served from the cloned website and yield less setup overhead. Overall, the cloning feature makes it extremely fast and easy for you to get a web page up and running.

Phishing Tip #2: Set up a real looking domain.

A domain name is the most obvious telltale of a suspicious website, so it's important that you use a domain name that is a close match to the real one. For example, the fake domain name for Rapid7 can be something like RAP1D7 or RAPID7. Obviously, a URL like http://www.RAPID7.com/home looks much less nefarious than http://196.184.132.24/home.

Since most people should be able to recognize a blatantly fake URL, you should use a real looking domain name. This will test a human target's ability to examine URLs and identify malicious links.

In order to set up a domain name for your Metasploit web server, you'll need to own and register the domain name. Once you have all of that set up, you'll need to point the domain name at the server running your Metasploit instance.

Phishing Tip #3: Target a smaller population.

To maintain the sanity of your IT team, you should use smaller target lists for the majority of your social engineering tests. With smaller target lists, you will be able to easily mitigate any issues and concerns that may arise.

Additionally, by limiting the number of human targets, you can control the sample of people participating in the test. For example, you may want to create a separate target list for your IT team because they may require a different type of social engineering test than the rest of the company.

However, there may be occasions where you want to run large scale tests. These tests will typically replicate a real attack scenario in which a large portion of the organization is affected. In these particular cases, you should create a large target list that includes all the targets in the organization. These large scale tests will help the organization understand their current security posture and identify where improvements need to be made in the IT and security infrastructure.

Showin	g 1 to 4 of 4 entries		First Previous 1 Next Last

Phishing Tip #4: Use a SMTP relay service.

One of the most common issues you may encounter during a social engineering test is the inability to send e-mail through your local mail server. Most mail servers will perform a reverse DNS lookup to verify that the IP address of the server hosting Metasploit Pro matches the domain name of the e-mail that you are trying to spoof. If there's an issue with the reverse DNS lookup, the mail server will most likely reject the e-mail because it appears to originate from a suspicious source.

Since mail servers are configured to use the highest level of protection and to perform restrictive checks for spam, malicious e-mails, and e-mail abuse, it makes it very difficult to successfully deliver phishing e-mails.

To work around this issue, you should use an SMTP relay service, like Sendgrid, JangoSMTP, or Mandrill. Publicly available e-mail services, like Gmail, Hotmail, and Yahoo should not be used because they enforce the highest level of security and will most likely blacklist any e-mail that appears to be spam. Regardless of the provider you choose, always send yourself the phishing emails first to verify they get delivered with a low or zero spam rating to increase your chance of success.

Phishing Tip #5: Capture credentials.

If you intend to use a social engineering assessment to promote security awareness, you should use Metasploit Pro's phishing campaign to launch a spoofed website to capture credentials. Unfortunately, nothing affects change faster than stolen credentials.

The phishing campaign is preconfigured with the components that you will need to create the phishing email, spoofed page, and redirect page. After you set up and launch the phishing campaign, you can observe the campaign findings in real-time. From the real-time findings, you can easily identify the human targets that have submitted their credentials and actually view the information that they have submitted.

Due to the open nature of spoofed page content, Metasploit Pro does not have the ability to hide credentials in the Social Engineering Campaigns Details report. Therefore, due to the sensitive nature of this content, the form submission content is not automatically included in the report. If you choose to create a custom report outside of Metasploit Pro, and opt to include the collected form submission content, please be sure to obfuscate a portion of the data - especially if you are showing sensitive data like passwords or credit card numbers.

Phishing Tip #6: Spoof the hover text.

The easiest way to identify a phishing e-mail is by hovering over the links embedded in the e-mail. To make the phishing e-mail more authentic looking, you should use the spoof hover text to URL option to modify the hover text. This option is available through the Link to web page attribute and changes the URL that displays in the hover text to any URL you want to use.

For example, if your Metasploit Pro instance runs on a web server that does not point to a DNS server, your web server URL will be something like http://1.2.3.4/blue123. If this is the case, you will want to change the hover text to display a URL that looks like it directs to a real web page, like http://www.rapid7.com.

USB Baiting

If you've ever been in an office environment, you may have noticed random USB keys scattered around. If these USB keys are left next to the copy machine or coffee machine, you may think that the owner has misplaced the key. So, your first instinct may be to install the USB key to examine its contents in order to identify the owner.

When you view the contents of the USB key, you may see a file that is aptly named to get you to open it. For example, you may be more likely to open a file name like "Joe_Resume.pdf" because it may contain useful, personal information about the owner of the USB key. Unfortunately, these files are usually not as innocuous as they seem. Opening one of these files can install malicious code onto your computer and give an attacker access to your system.

USB baiting, or a USB key drop, uses thumb drives to deliver malicious payloads and heavily relies on human curiousity to be successful. Most baiting schemes require that you have access to the comany's office facilities, which may require you to utilize some creative techniques in order to get through the front door. For example, you may need to dress up like someone from technical support or you may spend some time building a relationship with someone in the company.

During a social engineering penetration test, you should leverage USB key drops to raise security awareness, ensure adherence to security procedures, and improve defense strategies within an organization.

Aside from phishing, one of the other major capabilities of Metasploit Pro is the ability to generate and download a malicious file, such as an executable or an infected file, that can be placed onto a USB key. You can create a malicious file, such as a PDF that contains the Adobe Cooltype exploit, with the portable file component. After you create the malicious file, you will need to download the file, save it to a USB key, and drop the key off in a high traffic area.

Now that you have a general overview of how baiting works, let's go over some tips that will help you set up successful baits.

USB Baiting Tip #1: Carefully research and plan the attack.

As with any other penetration test, research and planning play a vital role in setting up a successful USB key drop. USB key drops are different from standard phishing attacks because they require you to physically access an unfamiliar location and attack systems with possibly very little reconnaissance.

Therefore, two of the most important elements you should research are the location and the potential target systems.

For a USB key drop to be successful, you need to identify an area in your targeted location that gets the most traffic. A high traffic area will most likely yield a higher possibility that someone will pick up a USB key and install it onto their system. Additionally, if you do not have direct access to the targeted location, you may need to create a back story to gain entry into the location. For example, you may want to pretend to be part of a maintenance crew or delivery service, which may require you to obtain the appropriate uniform and props to play the role.

When researching the location, you will need to ask yourself questions like:

"How will I get in?"

"What's my story for being there?"

"Where are the high traffic areas located?"

"Who might I encounter?"

Answering questions like these will help you prepare and plan for a USB key drop.

Since you cannot control who picks up the USB key, you do not know if their system will be vulnerable to the exploit on the USB key. Therefore, it is important that you gather as much information as you can about the systems within the organization so that you can choose the most relevant and effective exploits. For example, if you know that most systems run Windows, you can tailor your attack to use Windows only exploits. Or if you know that most systems have Adobe Reader, you can use PDFs to deliver your exploits.

With extensive research, you can build an effective and strategic plan of attack that will provide clear insight into the organization.

USB Baiting Tip #2: Use descriptive and enticing file names.

When someone finds a USB key, their natural inclination may be to insert the USB key to find the owner or to view the contents of the drive. Therefore, you should always use file names that indicate that the file contains personal or confidential information. For example, a file name like "ContactInfo.pdf" or "payroll.exe" will be more likely to lure someone into opening it.

Malicious Attachments

A malicious attachment is a file format exploit or executable file that is e-mailed to a human target. The email appears to come from a trusted source and always contains an attachment that must urgently be

downloaded.

Some of the most prolific social engineering attacks have started with the innocuous act of the opening an e-mail attachment. The attached file contains an exploit that delivers a malicious payload to the target's system, which in turn, makes the system vulnerable to viruses, malware, spyware, and trojans. In some cases, the attack creates a chain of events that can compromise the entire network.

Most likely, the recipient was completely unaware that the attachment was harmful because the e-mail appeared to originate from a familiar source. Similarly to phishing attacks, the attacker has manipulated the recipient into believing that the e-mail was authentic and that the attached file was trustworthy. For example, personalized corporate e-mails about stock options and health insurance are more likely to lure someone into reading them and downloading any files attached to them than generic e-mails about sales figures.

As a social engineering penetration tester, you need to identify the potential risks that malicious attachments pose to an organization and provide solutions that can mitigate those risks. It is important to provide employees with the necessary skills to reduce the risk that they pose to an organization and to identify the most pervasive vulnerabilities that the organization needs to address.

Now that you have a general overview of malicious attachments, let's go over some tips that will help create malicious e-mails and attachments.

Malicious Attachments Tip #1: Craft a convincing and legitimate looking e-mail.

To appeal to a human target's sense of trust and curiosity, you need to create an e-mail that not only looks legitimate, but contains information that is of interest to the human target.

Any e-mail you create should use the same logo, font, and colors that the real one would. If you are spoofing a corporate e-mail, you should use a real e-mail as a model so that you can accurately recreate the exact header, footer, and signature. These elements provide visual cues to the target that the e-mail comes from a trusted and familiar source.

In order to convince the human target to actually open an attachment, you need to persuade them that the attachment contains information that they absolutely need to view. Typically, people will want to view any information that they think will impact them directly. For example, an e-mail about annual bonuses with an attachment named 2013_bonus_plan.pdf will probably get more views than an e-mail about a new corporate handbook.

Malicious Attachments Tip #2: Use a common file format exploit.

Depending on the information you have gathered about the target systems, you should use exploits that are delivered using a common file format type. For example, most Windows systems in an corporate

environment will have Microsoft Windows or Adobe Reader. Therefore, when choosing a file format exploit, you should factor in the likelihood that the target will have the necessary software to open the file.

Malicious Attachments Tip #3: Zip attached files.

Most e-mail services will not deliver an executable file attached directly to an e-mail. So, if you want to attach an executable file to an e-mail, you should always send the file in a Zip file. This reduces the possibility of the attachment being flagged as a malicious file.

Task Chains

Task chains enable you to automate and schedule the execution of a series of preconfigured tasks. They are useful for automating repetitive tasks that you need to perform regularly, such as scans and bruteforce attacks.

A task chain comprises of a sequence of predefined tasks that you can schedule to run on a recurring basis or save to run on demand. It defines the tasks that will run, the settings for each task, and the conditions required for the execution of those tasks. You create a task chain by adding the tasks you want to it, configuring the settings you want the tasks to use, arranging the tasks in the order you want them to run, and defining the schedule that it should follow.

Task chains are particularly useful if you want to run a sequence of tasks, but do not want to wait for each task to finish before you can run the next task. For example, if you routinely scan and bruteforce a set of targets hosts, you can string the tasks together so that they run sequentially at a specified time and date.

Task Chain UI Tour

Task chains tasks are separated into two different areas:

- Task chains list Displays all the task chains that are stored in the project. From this list, you can bulk manage task chains, view the current status for a task chain, view the contents of the task chain, and identify when a task chain will run next.
- **Task chain configuration page** Displays the contents of a task chain. From this page, you can add, configure, and rearrange tasks, and you can create the schedule for the task chain.

Task Chains List

To access the Task Chains list, select **Tasks > Chains**. The list displays all the task chains that are available in the project.

Home 🔰 d	default Task Chains						
Task	Chains		2		1		
	Delete Clone	Stop	Suspend Unsuspe	nd Run Now 🕨	+ New Task Chain

	•	weekly-test	03-21-2014 12:22 PM	tdoan	SCAN	Last Run Mar 21, 2014 Next Run Mar 29, 2014	

- 1. New Task Chain button: Opens the New Task Chain configuration page.
- 2. <u>Task chain bulk management buttons</u>: Bulk manages task chains. You can do things like delete, clone, suspend, and run multiple task chains at once.
- 3. <u>Task chains list</u>: Lists all of the task chains that have been created for the project.

Each task chain will have one of the following schedule icons:

- Recurring Schedule: Indicates that the task chain repeatedly runs at a specified time and day.
- Single Schedule: Indicates that the task chain is scheduled to run once at a specified time and date.
- Not Scheduled: Indicates that the task chain does not follow a schedule.
- Suspended: Indicates that the task chain is inactive.
- 4. Task chain status: Displays one of the following statuses for each task chain:
 - Never run: The task chain has never run.
 - Running: The task chain is currently running.
 - Last run: The task chain last ran successfully at the specified date.
 - Failed: The task chain was unable to finish successfully. If the task chain failed, it will display a link that you can click on to open the Task log and view the errors that occurred.

Task Chain Configuration Page

You access the task chain configuration page to create a new task chain or to modify an existing task chain.

To access the task chain configuration page, select **Tasks > Chains** from the Project tab bar. When the task chains list appears, click the **New Task Chain** button.

	arris. weekly test						
-	9 2	3	-4-	5	6	7	
Scan	Bruteforce	Collect	Bruteforce	Collect	Cleanup	Report	
							* denotes require
+ Target Settir	igs						
+ Advanced Ta	rget Settings						
+ Discovery Se	ettings						
+ Discovery Cr	edentials						
+ Web Scan Se	ttings						
+ Automatic Ta	agging						
+ Web Crawler	Settings (Advanced)						

- 1. <u>Task Chain Name field</u>: Displays an editable field for the task chain name. You can click on the field at any time to edit its name.
- 2. Schedule status: Indicates whether or not a schedule has been created for the task chain.

It displays one of the following statuses:

- Scheduled: Indicates that a schedule has been created for the task chain.
- Unscheduled: Indicates that a schedule has not been created for the task chain.
- 3. <u>Schedule Now link</u>: Opens the Task Chain Scheduler, which enables you to schedule and suspend task chains. Additionally, you can enable the option to clear project data before the task chain runs.
- 4. Save and Run button: Saves the current task chain configuration and immediately runs the task chain.
- 5. <u>Save button</u>: Saves the current task chain configuration. The task chain will be available for you to run on demand or it will run according to the schedule that you have created for it.
- 6. Delete task: Removes the selected task from the task chain.
- 7. Clone task: Duplicates the selected task and adds it to the end of the task chain.
- 8. Reset task configuration: Clears all tasks from the task chain.
- 9. <u>Task bubble</u>: Represents a task. You can click on a task bubble to open the task configuration form. The selected task bubble will be highlighted in blue.

Any task highlighted in red indicates that the task has not been configured correctly and the task chain cannot be saved. You can click on the task to fix the issues on the task form.

You can also click and drag the task bubble to move the task to a new position in the task chain.

- 10. Add Task button: Displays the task list and enables you to select the task that you want to add to the task chain.
- 11. <u>Task configuration form</u>: Displays the options that you can configure for the task that is selected. Options will vary depending on the task that is selected.

Supported Tasks

Task chains can be used to execute the following tasks:

- Discovery scan: Enumerate and fingerprint hosts on a target network.
- Import: Bring in data from supported third-party scanners, such as Nexpose and Nessus.
- Vulnerability scan: Scan a target network with Nexpose to find vulnerabilities on a target network.
- Web scan: Scan web forms and applications to find and exploit active content and forms.
- Bruteforce: Systematically attempt various combination of letters, numbers, and characters to crack credentials.
- Auto-exploitation: Automatically build an attack play by cross-referencing open ports, imported vulnerabilities, and fingerprint information to exploit modules.
- Single module run: Launch a module to perform targeted attacks against hosts or to gather additional data about hosts. You can add multiple modules to a task chain.
- MetaModule run: Launch one of the following MetaModules: the Single Password Testing MetaModule, the Known Credentials MetaModule, the SSH Key Testing MetaModule, the Pass the Hash MetaModule, the Firewall Egress Testing MetaModule, or the Passive Network Discovery MetaModule.
- Evidence collection: Collect evidence, such as screenshots, password hashes, and system files, from compromised hosts.
- Session clean up: Close any open sessions on compromised hosts.
- Report generation: Create a report to document findings and share test results.

Working with Task Chains

Task chains enable you to automate and schedule the execution of a series of repetitive tasks that you need to perform regularly, such as scans and bruteforce attacks. A task chain defines the tasks that will run, the settings for each task, and the conditions required for the execution of those tasks. You create a task chain by adding the tasks you want to it, configuring the settings you want the tasks to use, arranging the tasks in the order you want them to run, and defining the schedule that it should follow.

Creating a Task Chain

1. From within a project, select Tasks > Chains from the Project tab bar.

The task chains list appears.

2. Click the New Task Chain button.

Home $>$ d	lefault >	Task Chains						
Task	Chai	ns						
	Delete 0 of 2	Clone task chains selec	Stop	Suspend Uns	uspend Run Now 🕨	+ New Task Chain		
		SCHEDULE	NAME 🔺	LAST UPDATED	CREATED BY	TASKS	HISTORY	STATUS
		O.	nightly	03-20-2014 3:23 PM	tdoan	SCAN	Never Run Unscheduled	
		Q	weekly	03-20-2014 3:25 PM	tdoan	SCAN	Never Run Next Run Mar 20, 2014	

The New Task Chain page appears.

3. Enter a name for the task chain in the Task Chain Name field.

Task Chain Name: Hask-chain	Schedule Now Cancel Save and Flux Save
	>

4. Click the '+' button to add a task.

Home cookie New Task Chain	
Task Chain Name: Jask-chain	Cancel Save and Run Save
D	>

The task list appears.

5. Select a task from the list.

SCAN MPORT		>
NEXPOSE BRUTEFORCE EXPLOIT MODULE RUN	No tasks have been added yet.	

A new task bubble appears on the task chain and the task configuration page displays below the task chain.

+ Target Settings	denotes rei
+ Advanced Target Settings	
+ Discovery Settings	
+ Discovery Credentials	
+ Web Scan Settings	
+ Automatic Tagging	
+ Discovery Settings - Discovery Credentials + Web Scan Settings	

6. Configure the task as you usually would.

After you configure the task, you can add additional tasks to the task chain. When you finish building the task chain, you can create a schedule for the task chain or you can save the task chain to run on demand.

Adding a Task to a Task Chain

To add a task to a task chain, click the '+' Add task button.

Home to New Task Chain		
Task Chain Name: Inightly-scan	1	Cancel Save and Run Save
		>

When you click the '+' button, the task list appears and shows you the tasks that can be added to the task chain.

Home to New Task Chain		
Task Chain Name: nightly-scan		Now Cancel Save and Run Save
	_	>
BRUTEFORCE EXPLOIT MODULE RUN + Target Settin COLLECT EVIDENCE CLEANUP		* denotes required field
REPORT re	sses* 10.9.0.0	

After you add the task, a new task bubble appears on the task chain, and the task configuration form displays below the task chain.

Home to New Task Chain		
Task Chain Name: Inightly-scan		Cancel Save and Run Save
Task bubbl	e	>
Task configuration form		* denotes required field
+ Automatic Tagging		

The task bubble displays the tasks' position in the task chain. A task in the first position displays a number '1', a task in the second position displays a number '2', and so forth. You can click the task bubble and drag it to reposition it in the task chain.

Any task bubble highlighted in red indicates that the task has not been configured correctly and the task chain cannot be saved. You can click on the task to fix the issues on the task form.

Cloning a Task

When you clone a task, you are adding a copy of the task to the end of the task chain. You can move or modify the task as needed.

Note: You should only clone tasks that are highlighted in blue, which indicate that there are no errors in the task configuration.

To clone a task, click the task you want to clone to select it.

Home Cookie New Task Chain	
Task Chain Name: [nightly-scan	Cancel Save and Run Save
	>

Then, click the **Clone** button located in the task chain tool bar.

Task Chain Name: hightly-scan	1	Cancel Save and Run Save
		>

The cloned task will be added to the end of the task chain.

Home Cookie New Task Chain							
Task Chain Name: nightly-scan		Cancel Save and Run Save					
D Scan Scan		>					

If you need to reposition the task in the task chain, click on the task and drag it to the position you want it to appear in the task chain.

Rearranging Tasks in a Task Chain

To move a task to a different position in the task chain, click the task bubble and drag it to reposition it in the task chain.

Home cookie New Task Chain								
Task Chain Name: hightly-scan		I		Cancel Save and Run Save				
- 1 - 3 - 2 - 1 - 3 - 2 Bruteforce				>				

After you reposition the task, the position that displays in the task bubble is updated. A task in the first position displays a number '1', a task in the second position displays a number '2', and so forth.

Adding a Post-Exploitation Module to a Task Chain

Post-exploitation is the phase that occurs after the system successfully exploits the target. It is the process that you use to identify information that helps you gain further access to the target or to additional systems within the target's internal networks.

When you manually run an attack against a target and get an active session, Metasploit Pro provides actions that you can take against the session. The actions are available on the session page and vary based on the session type, such as shell or Meterpreter, and system information. For example, if the system opens a shell on a target, the actions that you can take include opening a command shell that connects to the target and collecting system data. If the system opens a Meterpreter session, you can do things like set up a proxy pivot or access the file system.

Using the target system information, automatically displays the post-exploitation modules that are applicable to the target. This makes it easy for you to identify and choose the post-exploitation modules that you want to run against the target.

When you work with task chains, the post-exploitation process is completely manual. You must search for the post-exploitation modules that you want to use based on the information that you have about the target. For example, if you know the target is a Windows system, and you want to capture screenshots, you may want to add a module task to your task chain that runs post/Windows/gather/screenshot. Or if you know your target is a Linux system, and you want to collect hashes, you may want to run post/linux/gather/hashdump.

Removing a Task from a Task Chain

To remove a task from a task chain, click the task you want to delete to select it.

Home cookie New Task Chain	
Task Chain Name: hightly-scan	Cancel Save and Run Save
	>

Then, click the **Delete** button located in the task chain toolbar.

Home default Task Chains Editing monthly		
Task Chain Name: mightly-scan	Weekly on Tuesdays	Cancel Save and Run Now Save
		>

A dialog window will appear and prompt you to confirm that you want to delete the task. Click **OK** to delete the task from the task chain.

You can only remove one task at a time. If you need to remove multiple tasks, please repeat the steps listed above or reset the task chain. For more information on resetting the task chain, see *Resetting a Task Chain* on page 305.

Note: After you remove a task from the task chain, you will not be able to recover the task. You will need to rebuild the task.

Clearing the Project Data before a Task Chain Runs

If you want to clear the project data before the task chain runs, you can enable the **Delete previous project data** option.

chedule a Task Cł	nain	🗌 Susper
Task Chain will occu Hourly until March 2I	: , 2015	
Run Chain Max Duration	Hourly t 5	minutes past the hour
	Delete Previous project data (Recommended)	
	Close Save	

Any and all data stored in the project, including hosts, collected evidence, session information, reports, and credentials will be wiped from the project. Enable this option only if you want to start the task chain with an empty project. Data cannot be recovered after it has been cleared from the project.

Resetting a Task Chain

You can reset a task chain to clear all of the tasks from it. A task chain reset will remove all tasks and their configurations from the task chain. This action cannot be reverted.

To reset a task chain, click the **Reset** button located in the task chain toolbar.

A dialog window will appear and prompt you to confirm that you want to reset the task chain. Click **OK** to reset it.

Running a Task Chain

You can run task chains on demand or outside the scope of its schedule.

To run a task chain, select **Tasks > Chains** from the Project tab bar.

Select the task chain that you want to run.

A dialog window will appear and prompt you to confirm that you want to run the task chain. Click **OK** to run it.

Managing and Editing Task Chains

Task chains are a series of preconfigured tasks that execute in sequential order. They are editable, cloneable, and suspendable, which makes it easy for you to manage and reuse task chains. For example, if you have an existing task chain that you want to reuse with a slightly different configuration, you can clone and customize that task chain.

Editing a Task Chain

You can edit a task chain to modify its existing settings. To edit a task chain, select **Tasks > Chains** from the Project tab bar.

When the Task Chains list appears, click on the name of the task chain that you want to edit.

Home	Home scan Task Chain Schedules

Cloning a Task Chain

When you clone a task chain, you are making a copy of it. Cloning enables you to reuse an existing task chain configuration. For example, you may want to clone a task chain if you want to run the same task chain on a different schedule or if you want to run a task chain with slight modifications.

To clone a task chain, select **Tasks > Chains** from the Project tab bar.

When the Task Chains list appears, select the task chain that you want to clone.

Home	Home Scan Task Chain Schedules									
Task Chains										
Delete 1 of 2	Defete Clone Stop Suspend Fun Now + + New Tesk Chain 1 of 2 task chains selected

	\bigcirc	weekly-test	03-11-2014 7:42 PM	tdoan	SCAN	Never Run Unscheduled				

The task chain configuration form appears. The form retains the configuration settings that you used to create the original task chain. You can run the task chain as is, or you can modify its settings.

The cloned task chain will use the following naming convention: [task-chain-name]-timestamp.

Suspending a Task Chain

You can suspend a task chain if you want the task chain to ignore its current schedule. When you suspend a task chain, it will not run again until you re-enable the schedule or manually run it yourself.

Note: When you suspend a running task chain, the task chain will be canceled. Do not suspend a running task chain unless you intend to stop it.

To suspend a task chain, select **Tasks > Chains** from the Project tab bar.

When the Task Chains list appears, select the task chain whose schedule you want to suspend. The task chain that you select must be scheduled and in an unsuspended state. These task chains will have a scheduled icon located next to them.

Note: If you need to bulk suspend task chains, you can select multiple task chains.

Click the Suspend button.

Cleaning Up Open Sessions

A task chain that includes a task like bruteforce, exploit, or module run may open a session on the target system. An open session enables you to interact with the compromised system. When you are done with a session, you should close the connection with the target.

To clean up and close open sessions, you should add a clean up task to the task chain. As a rule of thumb, the clean up task should be the last task in the task chain. This ensures that has the opportunity to collect system information and take advantage of open sessions before it closes them.

Deleting a Task Chain

When you delete a task chain, it will be permanently removed from the project, and you will no longer be able to access or run it. You will not be able to recover a deleted task chain.

To delete a task chain, select **Tasks > Chains** from the Project tab bar.

When the Task Chains list appears, select the task chain that you want to delete.

Home	scan Task Cl	nain Schedules

Task Chain Schedules

A schedule defines how often and when a task chain runs. You can choose to run the task chain hourly, at specific time on certain week days, monthly at a set frequency, or you can save the task chain to run as you need.

For example, let's say you want to run the task chain every day at 12 a.m. You will need to configure the task chain to run daily at midnight starting on a specific date. You can also set optional conditions--such as the maximum run time for the task chain and the expiration date for the schedule.

The following image shows the Task Chain Scheduler and the configuration for the previous example:

Task Chain will occur: Daily Run Chain Daily • Run Every 1 Day(s) Start on 03/22/2014 @ 03:00 pm -0500
Run Chain Daily • Run Every 1 Day(s) Start on 03/22/2014 © 03:00 pm -0500 00/2014
Never Expire V

Schedule Options

There are a few different schedule options that you can use to control when a task chain runs. The following schedule options are available:

- Once Runs the task chain once on a specific date. For example, you may want to choose this option if you want to run the task chain once at midnight on December 15, 2014.
- Hourly Runs the task chain every hour. For example, you may want to choose this option if you want to run the task chain at half past every hour.
- **Daily** Runs the task chain every day. For example, you may want to choose this option if you want to run the task chain every day at midnight.
- Weekly Runs the task chain on certain days of the week. For example, you may want to choose this option if you want to run the task chain every Monday and Wednesday at midnight.

• **Monthly** - Runs the task chain on a specific day of the month. For example, you may want to choose this option if you want to run the task chain on the last day of each month.

Scheduling a Task Chain

- From within the project that contains the task chain you want to schedule, select Tasks > Chains from the Project tab bar.
- 2. Find and open the task chain you want to schedule.

Home	Home scan Tesk Chein Schedules								
Tas	Task Chains								
Delete 0 of 3	Delete Clone Stop Supprid Unsupprid + New Task Chain 0 of 3 task chains selected < <td> </td>								
	SCHEDULE	NAME	LAST UPDATED	CREATED BY	TASKS	HISTORY	STATUS		
	Q	weekly-test	03-17-2014 4:20 PM	tdoan	SCAN	Never Run Unscheduled			
	Q	nightly-test	03-17-2014 9:25 PM	tdoan	SCAN	Last Run Mar 17, 2014 Next Run Mar 17, 2014			
	Ø.	daily-test	03-17-2014 9:27 PM	tdoan	SCAN	Never Run Unscheduled			

The configuration form for the task chain opens.

3. Click the Schedule Now link.

Home	scan 🖉 Task Chains 🖉 Editing daily-test		
Tas	k Chain Name: daily-test	Schedule Now	Cancel Save and Run Now Save
1 •• 5			>
			* denotes required field
	+ Target Settings		
	+ Advanced Target Settings		
	+ Discovery Settings		
	+ Discovery Credentials		
	+ Web Scan Settings		
	+ Automatic Tagging		
	+ Web Crawler Settings (Advanced)		

The scheduler appears.

4. Click the **Run Chain** dropdown to display the recurrence options.

Run Chain	Once	
Start on	Once	
	Hourly	
	Weekly	rious project data (Recommended)
	Monthly	

You can choose once, hourly, daily, weekly, or monthly. The options that appear depend on the recurrence option you have selected.

For example, if you want to run the task chain daily, you will need to specify if the task chain should run every day, every 2 days, every 3 days, and so on. You must also indicate the date and time you want the task chain to start.

5. Click the Max Duration dropdown and choose a time limit for the task chain. (Optional)

Schedule a Task Cł	nain	Suspend
Task Chain will occur Weekly on Tuesdays		
Run Chain	Weekly • on SM W TFS	
Start on	03/28/2014 @ 07:22 am -0500	
Run Every	1 week(s)	
Max Duration	Never Expire	
	Delete Previous project data (Recommended)	
	Close Save	

6. Click the **Done** button to save the schedule.

The scheduler closes and the task chain configuration page appears.

7. Save the task chain.

The task chain will run according to the date and time you have scheduled.

Suspending a Schedule

You can indefinitely suspend a schedule from the Scheduler or from the Task Chains List. When you suspend a task chain, it will not run again until you re-enable the schedule or manually run it yourself.

To suspend the schedule, select the Suspend option located on the Scheduler.

chedule a Task Ch	nain		Suspe

Setting the Maximum Duration for a Task Chain

The maximum duration is the time limit that you want to enforce on a task chain. You set a maximum duration if you do not want a task chain to exceed a certain time frame. Once the task chain reaches the maximum duration, it will be stopped in its current state. All data that has been collected until that point will be saved in the project.

To set a time limit on the task chain, use the Max Duration option located on the scheduler.

lain	Suspend 🗌

If you do not want to set a time limit on the task chain, you can set the maximum duration or Never Expire.

Reports

A report clearly presents project data in a distributable and tangible output format. It organizes your findings into relevant sections, displays charts and graphs for statistical data, and summarizes major findings. This is extremely useful when you need to share information with people who do not have access to Metasploit Pro or who want to quickly process your test results.

All tasks related to reports, such as generating, downloading, e-mailing, and deleting them, can be performed from the Reports area of the web interface.

Notification Center Statuses for Reports

When you generate a report, the Notification Center alerts you when a report has started generating, finished generating, or encountered an error during generation. The Notification Center appears as an icon in the upper-right corner of the global toolbar and displays the total number of unread notifications. You can click on the Notification Center icon to display a list of alerts.

The Notification Center displays the following statuses for reports:

- Report started: This status indicates that the report has started generating.
- <u>Report finished</u>: This status indicates that the report was generated without errors and is ready for you to view and download. You can click on the alert to open the report. When you open the report from the Notification Center, it displays a unified view of the report and shows the formats that are available for it. You can click on any of the format icons to view the report in the selected format.
- <u>Problem with report</u>: This status indicates that there was an issue with the report and it was not able to finish. You will need to view the report log to troubleshoot the issue.

Generating a Standard Report

- 1. Open the project that contains the data you want to use to create a report.
- 2. Select **Reports > Create Standard Report** from the Project tab bar.

M metasoloit"	Project - demo 🔻									Account - tdoan 🔻	Administration \mathbf{v}	? 8
	0.	verview Analysi	s Sessions	Campaigns	Web Apps	Modules	Reports 2	Exports	Tasks

The Reports page appears with the Generate Standard Report tab selected.

3. Click the **Report type** dropdown and choose the report you want to generate.

Report Type		
Report type*	Activity	?
	Activity	
	Audit	
File Formate	Authentication Tokens	
File Formats	Collected Evidence	
File formats*	Compromised and Vulnerable Hosts	?
	FISMA Compliance	•
	PCI Compliance	
	Services	
	Social Engineering Campaign Details	
	Web Application Assessment	

4. Choose the file formats you want to generate for the report.

HTML	?
PDF	
RTF	
WORD	
	HTML PDF RTF WORD

You can generate multiple formats for a report at the same time. Most reports can be generated as PDF, Word, RTF, or HTML documents; however, the Web Application Assessment Report cannot be generated as a Word file.

5. Enter a name for the report in the **Report Name** field. (Optional)

Name			
	Name*	Audit-20140310123607	?

If you do not specify a name, Metasploit Pro uses the report type and the timestamp. For example, an Audit Report will be named Audit-20140106140552.

6. Use the **Included addresses** to explicitly define the hosts you want to include in the report. (Optional)

For example, if you only want to include specific hosts in the report, you should define those hosts in the **Included Addresses** field. All other hosts will not be included in the report.

7. Use the **Excluded addresses** to explicitly define the hosts you want to exclude from the report. (Optional)

For example, if you only want to exclude specific hosts from the report, you should specify those hosts in the **Excluded Addresses** field. All other hosts will be included in the report.

8. Click the **Campaign** dropdown and select the campaign you want to use to create a report. (Social engineering reports only)

The report form only displays the campaigns that are stored in the project.

Click the Cover Logo dropdown and select the logo that you want to use on the cover page of the report.

Cover Logo			
	Custom report logo	metasploit-logo 🛩	?

If you have not uploaded a logo to the project, you must upload the logo that you want to use to the Custom Report Collateral area of the project.

10. Select the report sections that you want to include in the report.

The report sections that are available will vary between reports.

11. Enable or disable any report options to manage the data that appears in the report.

The report form displays the options that are applicable for the report type that you have selected.

The following report options may be available:

- <u>Mask discovered passwords</u>: Removes all credentials, including plain text passwords, hashes, and SSH keys, from the report. The report displays the user name and a blank password.
- <u>Include session details</u>: Shows the details for each session Metasploit Pro was able to open, such as the session type and attack module that Metasploit Pro used to obtain the session.
- <u>Include charts and graphs</u>: Includes visual aids, such as pie graphs, to accompany statistical findings in a report.
- Include web page HTML (in addition to image preview): Includes the original page code as raw text as well as the rendered preview image. (Social Engineering Campaign Details Report only)
- 12. Enter the e-mail addresses you want to send the report to after the report generation. (Optional)

You can use a comma or semi-colon to separate multiple e-mail addresses.

To e-mail a report, you must have an active mail server configured through the Global Settings.

13. Generate the report.

When the report generation begins, the web interface redirects you to the View Reports tab. At this point, you can navigate away from the Reports page to other areas in Metasploit Pro. The Notification Center will alert you when the report generation completes.

When the report generation completes, you can click on the Notification Center icon to view the notification message or you can select **Reports > Show Reports** from the Project tab bar to access the Reports area.

If an error occurred during report generation, you can view the report log to identify and troubleshoot any errors that occurred.

Generating Additional Formats for a Report

- 1. Open the project that contains the report for which you want to generate additional formats.
- 2. Select Show Reports from the Project tab bar. The Show Reports page appears.
- 3. Find the row that contains the report for which you want to generate additional formats.

The row shows the metadata and the file formats that are available for the report.

4. Click on the report name to open it.

The unified report view will open and display a preview of the report. The formats that are available for the report will be displayed in the sidebar. Formats that have a colored icon and checkbox have already been generated. Formats that are grayed out have not been generated.

5. Click on the file format that you want to generate for the report. You can only generate one format at a time.

When the report generation begins, the format button will be replaced with a progress indicator. The format button will reappear when the report is ready for you to view or download.

At this point, you can navigate away from the Reports page to other areas in Metasploit Pro. The Notification Center will alert you when the report generation completes.

When the report generation completes, you can click on the Notification Center icon to view the latest notification message or you can select **Reports > Show Reports** from the Project tab bar to access the Reports area.

If an error occurred during report generation, you can view the report log to identify and troubleshoot any errors that occurred.

Generating MetaModule Reports

A MetaModule provides a guided interface to walk you through a single penetration testing task. Each MetaModule leverages the core functionality of a module, such as password testing, but enables you to quickly configure and run the module with minimal set up. Each MetaModule includes a specialized report, which contains data that is specific to the MetaModule run.

MetaModule reports are configured from within the MetaModule and are generated when the MetaModule runs. After the MetaModule generates the report, you can view the report from the Reports area.

Scope*	Report is enabled Name* AuthMetaModule-2014031109 Sections Cover Page Project Summary Findings Summary Authenticated Services and Hosts Summ Authenticated Services and Hosts Detail Appendix: Report Options Selected		I1090337 (7) Coptions Mask discovered credentials include charts Summary Charts Details	
Payload				
Generate Report				
	Excluded	addresses 👔	Email Report (?)	
Generating a Custom Report

A custom report is created using a user-uploaded Jasper report template. The template defines the layout of the report and the sections that the report contains. You can create a report template from scratch using a tool like iReport. For more information on custom templates, see*Working with Custom Templates* on page 338.

Before you can generate a custom report, you must upload the template that you want to use to the Custom Report Collateral area of the project. If the project does not contain any custom report templates, the New Custom Report form will not load. Instead, the form displays a warning that the project does not contain any templates. You must upload a valid JRXML template to continue. For more information on uploading a custom template, see*Uploading Templates* on page 343.

To generate a custom report:

- 1. Open the project that contains the data you want to use to create a report.
- Select Reports > Create Custom Report from the Project tab bar. The New Custom Report page appears.

	Project - demo 🔻						Account - tdoan 🔻	Administration ${f v}$?	8
	Overview	Analysis	Sessions	Campaigns	Web Apps	Modules	Reports 2 Exports	Tasks		
							Show Reports

- 3. Select the template you want to use to create the report.
- 4. Choose the file formats you want to generate for the report.

File Formats		
File formats*	HTML	?
	Ø PDF	
	RTF	
	WORD WORD	

You can select multiple formats. All formats will be generated for the report at the same time.

5. Enter a name for the report in the Report Name field. (Optional)

Name		
Name*	Custom-20140310125739	?

If you do not specify a name, Metasploit Pro uses the report type and the timestamp. For example, an custom report will be named Custom-20140106140552.

6. Use the Included addresses to explicitly define the hosts you want to include in the report. (Optional)

For example, if you only want to include specific hosts in the report, you should define those hosts in the **Included Addresses** field. All other hosts will not be included in the report.

7. Use the **Excluded addresses** to explicitly define the hosts you want to exclude from the report. (Optional)

For example, if you only want to exclude specific hosts from the report, you should specify those hosts in the **Excluded Addresses** field. All other hosts will be included in the report.

8. Click the **Cover Logo** dropdown menu and select the logo you want to display on the cover page of the report. (Optional)

Cover Logo		
Custom report logo	metasploit-logo	?

If you do not select a logo, the report will use the default Rapid7 logo.

9. Enter the e-mail addresses you want to send the report to after the report generates. (Optional)

You can use a comma or semi-colon to separate multiple e-mail addresses.

To e-mail a report, you must have an active mail server configured through the Global Settings.

10. Generate the report.

When the report generation begins, the web interface redirects you to the View Reports tab. At this point, you can navigate away from the Reports page to other areas in Metasploit Pro. The Notification Center will alert you when the report generation completes.

When the report generation completes, you can click on the Notification Center icon to view the notification message or you can select **Reports > Show Reports** from the Project tab bar to access the Reports area.

If an error occurred during report generation, you can view the report log to identify and troubleshoot any errors that occurred.

Downloading a Report

- 1. Open the project that contains the report you want to download.
- 2. Select **Reports > Show Reports** from the Project tab bar. The **Reports** page appears.

[™ metasploit"	Project - demo 🔻						Account - tdoan 🔻	Administration $ extbf{v}$?	8

The row displays the metadata and the file formats that have been generated for the report.

4. Click on the format that you want to view the report in.

The report will open in your browser.

E-mailing a Report

You can quickly share reports by e-mailing them as soon as they are generated. Both the standard and custom report generation forms have an **Email Report** field that enables you to define a list of e-mail recipients.

Email Report	
Recipients	?

As long as you have a valid mail server configured for your Metasploit Pro instance, the report will automatically be sent to the e-mails you have listed.

Setting Up a Mail Server

In order to utilize e-mail capabilities, you must have access to a local mail server or a web mail server. You need the address and port that the mail server runs on, the domain name that hosts the mail service, and the credentials for the mail server.

Cloning a Report Configuration

You can clone a report to make a copy of an existing report's configuration. Report cloning enables you to reuse and rerun a previously generated report. You can modify the configuration or run it as it is.

To clone a report:

- 1. Open the project that contains the report you want to delete.
- 2. Select **Reports > Show Reports** from the Project tab bar.

The browser will ask you to confirm that you want to delete the report.

5. Select **OK** to delete the report.

Customizing Standard Reports

A standard report is based on a Metasploit report template, which controls the look and feel of the report. All reports have a cover page and include a set of options that enable you to manage the report data. You can customize some parts of a standard report, such as the logo and sections of content that appear in the report.

If you want to modify the layout of the report, you will need to use a custom template.

Excluding Report Sections

A report is made up of multiple sections. Each section divides the report content into distinct areas of information.

When you view the New Report form, you will see the sections that are available for the report you have selected. By default, all sections will be selected. If you want the report to only show certain sections of a report, you can exclude sections from the report.

To exclude specific sections, you can deselect the sections you do not want to appear in the report.

When you generate the report, you will not see the excluded sections in the report. Additionally, the report will only show content for the sections for which it has data.

Excluding and Including Hosts from Reports

When you generate a report, Metasploit Pro automatically includes data from all hosts in the project. If you want to limit the data to a particular set of hosts, you can create an inclusion or exclusion list.

Creating Inclusion Lists

An inclusion list defines the hosts that you want to include in a report. Only the data for the hosts that you have explicitly defined will be displayed in the report.

You create an inclusion list from the New Report form . Use the **Included addresses** field to define the specific hosts you want to include in the report. You can enter a single IP address, an address range, or a CIDR notation. If there are multiple addresses or address ranges, use a newline to separate each entry.

Address Settings		
Included addresses	192.168.1.0 192.164.1.1 192.164.1.2 192.164.1.3	3
Excluded addresses		

Creating Exclusion Lists

An exclusion list defines the hosts that you do not want to include in a report. The report will include data for all of the hosts in the project, except for the ones that you have defined in the exclusion list.

You create an exclusion list from the report generation form. Use the **Excluded addresses** field to define the specific hosts you want to exclude from the report. You can enter a single IP address, an address range, or a CIDR notation. If there are multiple addresses or address ranges, use a newline to separate each entry.

Address Settings		
Included addresses		3
Excluded addresses	192.164.1.1 192.164.1.2 192.164.1.3	

Masking Credentials from Reports

You can mask credentials if you do not want to include the plain text passwords and hashes in the Audit, Authentication Tokens, FISMA, and PCI reports.

To mask credentials from a report, you need to select the credential masking option on the New Report form. Select the **Mask discovered credentials** option to enable credential masking in your report.

Options Mask discovered credentials
Include session details
Include charts

When the masking option is enabled, the reports will not display plaintext credentials. For example, when you view the generated Audit report, the Compromised Credentials section only shows the host addresses, services, and user names that were discovered. The password, hash, and key fields are blank.

Compromise	d Creden	tials		
Host address	Service	Username	Password / Hash / Key	Masked
50.20.37.50	ssh/22	service		passwords
50.20.37.50	ssh/22	klog	4	
50.20.37.50	ssh/22	user		

Other reports, such as the PCI and FISMA reports, replace all credentials with <blank>.

Removing Charts from Reports

Charts visually present numerical data. They are effective when you use to them present and compare large sets of information. You can include them in a report to simplify quantitative data and to highlight trends in your findings. Metasploit Pro reports mostly use pie charts to illustrate how data is distributed across different categories.

Most reports, with the exception of the FISMA, PCI, Social Engineering, Web Application Assessment, and Activity reports, have the option to include charts. By default, this option is enabled, so charts will be automatically generated for applicable reports. If you do not want to include charts in your report, you can disable the charts and graphs option.

To exclude charts and graphs from a report, deselect the Include charts and graphs option.

Benort Ontions		
	Mask discovered passwords	?
	Include session details	?
	Include charts and graphs	?

Including Web Page HTML in Social Engineering Reports

The Social Engineering Report presents the findings and data for a particular campaign. It contains the details for the campaign components that you used to build the campaign, such as the target list, e-mail, and web pages used.

The raw content for the target list and e-mail will automatically be included in the report. If you want to include the raw content for the web pages, you will need to enable the **Include web page HTML** option. If enabled, this option includes the HTML for each web page used in the campaign. A preview of the web page will render in the report if the web page was used as part of a campaign.

Note: If the web page delivered malicious code, such as a client-side exploit, Java applet, or executable file, a preview will not be rendered for the web page.

If you want to include the raw HTML that was used to create a web page and a preview of the web page, you can select the **Include web page HTML** option on the New Report form.

Report Options		_
	→ Include web page HTML (in addition to image preview)	

Customizing Report Names

Metasploit Pro uses the following naming convention for report names: <report type>-<timestamp>. The report name appears in the Reports list.

You can change the name by replacing the default name in the **Report Name** field on the New Report form.

Report Name		
Report na	Webapp_assessment-4	?
		·

Adding a Custom Logo to a Report

All reports include a cover page that displays the title, logo, and timestamp. The cover page displays the Rapid7 image as the default logo on all reports.

If you want to replace the default logo, you can upload a JPG, GIF, or PNG file. The uploaded logo can be used to brand a report with your organization's identity. The logo appears in the right side of the cover page and replaces the default Rapid7 logo.

Logo Requirements

The logo area on the cover page is 320 x 320 pixels. You can upload an image that is larger than the logo area, but the logo will be resized to fit the cover page.

If the image is larger than the logo area, the height of the image will be preserved, but the width will be resized.

Uploading a Custom Logo

- 1. Open the project that you want to upload the logo to.
- 2. Select Reports > Create Custom Report from the Project tab bar.

The Reports page appears.

3. Find the Custom Report Collateral area.

The file appears under the Custom Report Collateral area.

Adding a Custom Logo to a Standard Report

To use a custom logo on the report's cover page, you need to click the **Custom report logo** dropdown on the New Report form and select the image you want to use. The dropdown will show the logos that have been uploaded to the project.

metasploit

Custom Logo			
	Custom report logo	• • ?	

If the project does not contain any logos, the New Report form will display a link to the Custom Reports page where you can upload your logo.

Cover Logo	
	To use an image other than the Rapid7 logo, upload one here.

Working with Custom Templates

Metasploit Pro ships with a set of predefined standard reports, which are created with Metasploit templates and designed to meet basic pentesting reporting requirements. However, if the standard reports do not provide you with the content or layout that you need, you can use a custom template to build your report. A custom template enables you to do things like apply corporate styles to your reports, control how and where content is displayed in your reports, and customize your reports for regional compliance needs.

A custom template is a JRXML file, which is an XML document with a JasperReport file extension. It contains the report structure, which defines where the report displays content, where it places images, and how it queries data. It can be built by directly manipulating XML or more easily by using a visual report tool for JasperReports, such as iReport Designer or the Eclipse-based Jaspersoft Studio.

Jasper Reports and iReport Designer

Metasploit Pro uses JasperReports 5.0, which is an open source Java-based reporting library, to compile JRXML templates and generate reports in output formats such as PDF, RTF, HTML, and Word. The JRXML template is a standards-based XML file that defines the elements and attributes that control where content is placed in a report. You can build the JRXML template with a visual report designer called iReport Designer, which is an open source tool maintained by Jaspersoft.

iReport Designer provides a graphical user interface that enables you to visually design your report templates without extensive knowledge of the JasperReports library, XML, and Java. You can drag and drop report elements to create layout of the report, and you can connect it to a data source, like JDBC and XML, to query data for the report. The resulting JRXML template can be imported into a Metasploit Pro project and used to create a custom report.

Downloading Jasper iReport

To download Jasper iReport, please visit the following site: http://jasperforge.org/projects/ireport.

Resources for JasperReports and iReport Designer

In order to build a custom template, you must be familiar with JasperReports and iReport Designer. There are quite a few resources available that will help you learn how to build report templates with iReport Designer and understand how JasperReports works.

To learn more about JasperReports or iReport Designer, visit the following resources:

• JasperReports documentation list - A list of the documentation that is available for JasperStudio, JasperReports Server, JasperReports Library, and iReport Designer. You can access this list at the

following URL: http://community.jaspersoft.com/documentation.

- JasperReports Library materials reference A list of the documentation, webinars, and articles that may be helpful for working with JasperReports. You can access this list at the following URL: http://community.jaspersoft.com/wiki/jasperreports-library-reference-materials.
- iReport Designer tutorials and help wiki A wiki that lists the tutorials that are available for iReport Designer. You can access this list at the following URL: http://community.jaspersoft.com/wiki/ireport-designer-tutorials-help.
- An article on chart customizations A useful list of chart customizers for JasperReports, iReport Designer, and JasperReports Server. You can view this article at the following URL: http://mdahlman.wordpress.com/2011/04/17/chart-customizers-2/.
- Groovy documentation Groovy is a Java-compatible scripting language that you can use in place of Java to define expressions in iReport.

To learn more about how Groovy and iReport Designer work together, visit the iReport wiki here: http://http://community.jaspersoft.com/wiki/ireport-designer-groovy.

To learn more about Groovy, you can view their documentation here: http://groovy.codehaus.org/.

 Jaspersoft training - To learn more about Jaspersoft training, you can visit https://www.jaspersoft.com/training-services or https://www.jaspersoft.com/training.

Requirements for Designing Custom Templates

To design a report template, you will need the following:

- Experience with Jasper iReport, JasperReports, XML, and SQL/XPath
- · Experience with Java or a Java scripting language, like Groovy or Javascript
- A working instance of Jasper iReport
- Access to the Metasploit database

Setting Up the Metasploit Database in iReport Designer

To fill your report with data, you will need to set up a data source that points to the Metasploit postgres server. The information for the Metasploit postgres server can be found in /path/to/metasploit/apps/pro/config/database.yml.

You will need the following information from the database.yml file:

- The database name The default database name is msf3.
- The postgresql port The default postgresql port is 7337.

- The user name The default user name is msf3.
- The password Please view the database.yml file for your database password.

To set up a data source in iReport Designer:

1. Open iReport Designer.

The Quick Start window appears.

2. Click the Database Connection icon.

The Datasource window appears.

3. Select Database JDBC connection from the list of data sources.

4. Click Next. The Database JDBC Connection window appears.

	Database JDBC connection
Name	
JDBC Driver	PostgreSQL (org.postgresql.Driver)
JDBC URL	jdbc:postgresql://localhost:5432/DatabaseName
Credentials	5
Username	
Password	
	Save password
ATTEN ATTEN passwo save it.	TION! Passwords are stored in dear text. If you dont specify a rd now, iReport will ask you for one only when required and will not

5. Enter a name for the connection in the Name field.

	Database JDBC connection
Name Metas	oloit PostgreSQL Server
JDBC Driver	PostgreSQL (org.postgresql.Driver) v jdbc:postgresql://localhost:5432/DatabaseName
Credentials Username	s
Password	Save password
ATTEN ATTEN passwo save it	TION! Passwords are stored in clear text. If you dont specify a rd now, iReport will ask you for one only when required and will not .

6. Replace with content in the JDBC URL field with jdbc:postgresql://localhost:7337/msf3.

Name Metasp	atabase JDBC connection
JDBC Driver	PostgreSQL (org.postgresql.Driver)
JDBC URL	jdbc:postgresql://localhost:7337/msf3
Username	•
Password	
ATTENT	Save password ION! Passwords are stored in clear text. If you dont specify a rd now, iReport will ask you for one only when required and will not

7. Enter the database user name in the Username field.

Data	abase JDBC connection
Name msf3	
JDBC Driver Po	stgreSQL (org.postgresql.Driver)
JDBC URL jdb	oc:postgresql://localhost:7337/msf3
Credentials Username msf	3
Password	
] Save password
ATTENTION password r save it.	N! Passwords are stored in clear text. If you dont specify a now, iReport will ask you for one only when required and will not

8. Enter the database password in the **Password** field.

	Database JDBC connection
Name msf3	
JDBC Driver	PostgreSQL (org.postgresql.Driver)
Credential	idbc:postgresql://localhost:7337/mst3
Username	msf3
Password	•••••
	Save password
ATTEN ATTEN passwo save it	TION! Passwords are stored in dear text. If you dont specify a ord now, iReport will ask you for one only when required and will not .

9. Test the connection.

If the connection is working properly, a window appears and alerts you that the connection was successful.

Otherwise, if the connection fails, an exception window appears and alerts you that there is an issue with your database settings. You will need to verify that your database settings match the information in the database.yml file.

10. Save the connection, if the connection was successful.

You are now ready to create your report template.

For resources on creating report templates, see*Resources for JasperReports and iReport Designer* on page 338.

Custom Resources Directory

All custom templates and logos are stored in the following directory: /path/to/metasploit/apps/pro/reports/custom_resources.

You can go to the custom resources directory to download or view logos and templates; however, you should not make any changes directly within the directory. If you need to modify your logos or templates, you should make a copy of the directory and make your changes from the new directory.

Any changes that you make directly from within the custom reports directory can cause disparities between the metadata that displays for the file in the web interface and the file itself. If you need to remove or add custom resources, you should do it from within the web interface. Do not delete them directly from the custom resources directory.

Uploading Templates

After you have created your custom template, you will need to upload it to the project you want to use to build the custom report. The template will only be available to the project that you have uploaded it to; therefore, if you want to use the template across multiple projects, you will need to import the template into each project.

When you view the New Custom Report form, the template will be available in the **Report Template** dropdown menu.

Downloading the Example Template

Metasploit Pro provides you with an example template that you can use as a reference when creating your own templates. The template provides simple examples that show you how you can query data, such as host IP addresses, names, operating systems, services counts, and vulnerabilities counts from a project, and display that information in a table. Additionally, you can see examples for adding a title and footer to the report.

\$P{product_name}		Vulnerability Survey Re	v and Service port (Sample)	Metaspl	oit Pro		Vulnerabi Survey R	ity and Servio leport (Sample

metasploit

Audit Report

The Audit Report presents the comprehensive findings for a project. It is useful when you want to obtain a detailed look at targeted hosts in a project. The report data is divided into two sections: Major Findings and Detailed Findings.

Major Findings

The Major Findings section presents host, operating system, and compromised credential data through tables and graphs. Its purpose is to help you quickly summarize and identify important data points in the report.

The Major Findings section includes the following data:

- The potential attack surface based on the number of discovered vulnerabilities and services per operating system.
- A breakdown of the host, service, and vulnerability counts for each operating system.
- The IP address, name, operating system, service count, and vulnerability count for each host in the project.
- The public and private values, realm type, realm value, origin, host count, and service count for each type of credential found in the project. All credentials are grouped according to their type. A credential can be a plaintext password, NTLM hash, non-replayable hash, or SSH key.
- A statistical breakdown of credentials by host, origin, service, and type.

Detailed Findings

The Detailed Findings section provides granular details for each host in the project. It includes the following data:

- The host names and IP addresses of all the targets in the project.
- The details of the credentials stored in the project, such as their public (username), private (password), realm type, realm value, and origin.
- The open services that were discovered on each host.
- The vulnerabilities that were discovered on each host.
- The web vulnerabilities that were discovered on each host.
- The modules that were able to successfully exploit a vulnerability and open a session.
- The activity for each session, such as when it was opened and closed and the commands that were run during the session.

Audit Report Options

Settings	Options
Output formats	PDF, HTML, WORD, RTF
Report options	 Mask discovered credentials - Removes all credentials, including plain text passwords, hashes, and SSH keys, from the report. The Audit report will display the user name with a blank password. Include session details - Shows the details for each session Metasploit Pro was able to open, such as the session type and attack module that Metasploit Pro used to obtain the session. Include charts and graphs - Includes visual aids, such as pie graphs, to accompany statistical findings in the report.
Report sections	Executive Summary Compromised Hosts Credentials Discovered OSes Discovered Hosts Host Details Discovered Services Web Sites

Credentials Report

The Credentials Report compiles the credential data, such as plaintext passwords, NTLM hashes, nonreplayable hashes, and SSH keys, from a project and presents it in a single unified view. The Credential Report is useful if you want to take a snapshot of the credential data in a project a particular moment in time and export the data in a tangible output, such as a PDF file.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Cover Page
- Project Summary
- Credentials Summary
- Credentials Details
- Login Details
- Host Details
- Module Details
- Appendix

Credential Summary

The Credentials Summary uses pie charts to visualize key findings according to the following categories:

- Private Types The relative distribution of private types for all credentials in the project.
- Credential Origins The relative distribution of credential origins for all credentials in the project.
- Top Hosts by Logins The relative distribution of logins across all hosts in the project.
- Top Shared Credentials by Related Hosts The relative distribution of credential pairs that are most commonly shared between hosts.
- Logins by OS The relative distribution of logins across different operating systems.
- Logins by Service The relative distribution of logins by service name.

Credential Details

The Credential Details presents the granular details of each credential that is stored in the project. Each credential will be grouped by its type: plaintext password, NTLM hash, non-replayable hash, or SSH key.

Each credential will have the following information:

- The public value
- The private value
- The realm type
- The realm value
- The origin
- The count of related hosts
- The count of related services

Login Details

The Login Details shows all validated logins that are related to the selected hosts, or validated logins that are related to all hosts in the workspace, if none are specified. Each login will have the following information:

- The service name
- The host name
- The login creation date
- The access level
- The public data
- The private data

Host Details

The Host Details lists the hosts in the project that have at least one credential or login. Each host will have the following information:

- The host name
- The IP address

- The date the host was added
- The count of logins for the host
- The number of credentials related to the host there were obtained from a login, service authentication, or looting a session

Module Details

The Module Details lists the modules that were used to obtain credentials. This section is divided into two parts: Service Origins and Session Origins.

Service Origins

The Services Origins section lists the modules that were used to authenticate to services to obtain credentials. These credentials are typically obtained by Bruteforce Guess, Credential Reuse, or Get Session.

Each module will have the following information:

- The module name
- The service name
- The number of logins related to the credential that was added by the module
- The date and time that the credential was added to the project. A credential is added when service authentication is successful.

Session Origins

The Session Origins section lists the modules that were used to obtain a session and then used to loot credentials from the compromised host.

Each module will have the following information:

- The module name
- The date and time the session was opened
- The number of credentials obtained with the module
- . The number of logins that are related to the credentials that were gathered by the module

Appendix

The Appendix provides additional details about the Credentials Report, such as the options that were used to generate the report and the glossary of key terms.

Credentials Report Options

Settings	Options
Output formats	PDF, HTML, WORD, RTF
Report options	Mask discovered credentials - Masks all credentials, including plain text passwords, hashes, and SSH keys, from the report. It replaces the private value with *MASKED*.
	Include charts and graphs - Includes visual aids, such as pie graphs, to accompany statistical findings in the report.
Report sections	Cover Page Project Summary Credentials Summary Credentials Details Plaintext Passwords NTLM Hashes Non-replayable Hashes SSH Keys Login Details Host Details Module Details Service Origins Session Origins Appendix: Glossary Appendix: Report Options

FISMA Compliance Report

The Federal Information Security Management Act (FISMA) provides a comprehensive framework that helps federal agencies implement processes and system controls that protect the security of data and information systems. FISMA is based on a set of standards and recommendations from technology agencies like the National Institute of Standards and Technology (NIST). NIST develops standards and guidelines, like the Special Publication 800-53 revision 4 (SP800-53r4), that federal agencies can use to build their FISMA compliance programs. The guide developed by NIST defines the minimum requirements for managing, operating, controlling, and operating information systems.

The FISMA Compliance Report attempts to help you assess where an organization stands in terms of compliance with specific FISMA requirements. Metasploit Pro reports findings for select requirements from the following families and security controls:

- Access Control AC7
- Awareness and Training AT-2
- Configuration Management CM-7
- Identification and Authentication IA-2, IA-5, and IA-7
- Risk Assessment RA-5
- System and Information Integrity SI-2 and SI-10

The report presents compliance results by indicating a pass or fail status for each FISMA requirement. The findings should be used as an appendix for FISMA requirements testing and not as an actual audit. For more information on each of these requirements, visit the National Vulnerability Database: http://web.nvd.nist.gov/view/800-53/Rev4.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Executive Summary
- Detailed Findings

Executive Summary

The Executive Summary lists the pass or fail status for each FISMA requirement that Metasploit Pro tests.

Detailed Findings

The Detailed Findings section provides the technical details for each FISMA requirement that Metasploit Pro reports on. The FISMA Compliance report will list each host that did not meet the criteria defined for each requirement.

FISMA Requirement AC-7

FISMA Requirement AC-7 mandates an enforced limit on the number of invalid login attempts made by a user. This requirement dictates that this rate be set by each organization based on their security policy. However, for the purposes of this report, a host will fail this requirement if it has more than 3 failed logins within 60 seconds for a particular public. This rate is considered a reasonable default.

For each host that failed this requirement, this section reports the following information:

- The IP address and name of the host on which the login attempts were made
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for each credential that resulted in more than 3 failed logins within 60 seconds of each other

FISMA Requirement AT-2

FISMA Requirement AT-2 mandates that security awareness training is provided to system users. The contents of the training program should be developed by the organization based on its needs and requirements. A host will fail this requirement if it has a vulnerability that was successfully exploited.

For each host that failed this requirement, this section reports the following information:

- The IP address and name of the host
- The operating system running on the host
- The vulnerability that was discovered, the module that was used to exploit the vulnerability, and the timestamp for when the exploit occurred

FISMA Requirement CM-7

FISMA Requirement CM-7 mandates that each host should have one primary function. A host will fail this requirement if it is running more than one major service, such as HTTP, HTTPS, DNS, FTP, MySQL, Postgres, DB2, and MSSQL. However, an exception to this requirement occurs when a host is running both HTTP and HTTPS. Since both services are often exposed together to support an application, they are allowed to run on the same host.

For each host that failed this requirement, this section reports the following information:

- The IP address and name of the host
- The operating system running on the host
- The major services running on the host

FISMA Requirement IA-2

FISMA Requirement IA-2 mandates that the host uniquely identifies and authenticates users. A host will fail this requirement it allowed a valid login using a common username, such as user, root, administrator, admin, tomcat, cisco, manager, sa, postgres, or guest. A host will also fail this requirement if a blank password was used to successfully authenticate to a service.

For each host that failed this requirement, this section reports the following information:

- . The IP address and name of the host on which the login was made
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for the credentials used

FISMA Requirement IA-5

FISMA Requirement IA-5 mandates that system authenticators, such as passwords and tokens, are properly created, distributed, and managed. This requirement ensures that authenticators are not shipped with default authentication credentials and enforce minimum password requirements. A host will fail this requirement if it allowed a valid login using a common username, such as user, root, administrator, admin, tomcat, cisco, manager, sa, postgres, or guest. A host will also fail this requirement if a blank password was used to successfully authenticate to a service.

For each host that failed this requirement, this section reports the following information:

- . The IP address and name of the host on which the login was made
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for the credentials used

FISMA Requirement IA-7

FISMA Requirement IA-7 mandates that mechanisms for authentication use acceptable cryptographic methods. A host will fail this requirement if it has any of the following services open: telnet, shell, rexec, rlogin, or POP3. A host will also fail this requirement if it is a Cisco device that has an open HTTP service.

For each host that failed this requirement, this section reports the following information:

- The IP address and name of the host
- The operating system running on the host
- The major services running on the host

FISMA Requirement RA-5

FISMA Requirement RA-5 mandates that vulnerability scans are performed regularly. A host will fail this requirement if it has a vulnerability that was successfully exploited.

For each host that failed this requirement, this section reports the following information:

- The IP address and name of the host
- The operating system running on the host
- The vulnerability that was discovered, the module that was used to exploit the vulnerability, and the timestamp for when the exploit occurred

FISMA Requirement SI-2

FISMA Requirement SI-2 mandates that all systems that have security flaws must be reported. All known vulnerabilities must have the latest vendor security patches applied. A host will fail this requirement if it has a vulnerability that was successfully exploited.

For each host that failed this requirement, this section reports the following information:

- The IP address and name of the host
- The operating system running on the host
- The vulnerability that was discovered, the module that was used to exploit the vulnerability, and the timestamp for when the exploit occurred

FISMA Requirement SI-10

FISMA Requirement SI-10 mandates that the syntax and semantics of information system inputs match the specified definitions for format and content. A host will fail this requirement if it has a vulnerability that was successfully exploited.

For each host that failed this requirement, this section reports the following information:

- The IP address and name of the host
- The operating system running on the host
- The vulnerability that was discovered, the module that was used to exploit the vulnerability, and the timestamp for when the exploit occurred
FISMA Compliance Report Options

Settings	Options
Output formats	PDF, HTML, WORD, RTF
Report options	Mask discovered credentials - Masks all credentials, including plain text passwords, hashes, and SSH keys, from the report. The FISMA Compliance Report will replace the password with *BLANK*.
Report sections	Executive Summary Detailed Findings

PCI Compliance Report

The PCI Compliance Report presents your findings based on Payment Card Industry Data Security Standard (PCI-DSS) 2.0 requirements, which represent a common set of industry tools and measurements that help ensure the safe handling of cardholder data. The PCI-DSS consists of 12 overall requirements, which are logically organized into the following groups:

- 1. Building and maintaining a secure network
- 2. Protecting cardholder data
- 3. Maintaining a vulnerable management program
- 4. Implementing strong access control measures
- 5. Monitoring and testing networks regularly
- 6. Maintaining an information security policy

The PCI Compliance Report describes where an organization stands in terms of compliance with PCI-DSS requirements related to groups 1, 3, and 4. The report provides coverage for a select subset of requirements within each group. It outlines the target's status for using default vendor settings, applying the latest security patches, and implementing strong user and password policies. The report presents compliance results by indicating a pass or fail status for each PCI-DSS requirement. The findings should be used as an appendix for PCI requirements testing and not as an actual audit.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Executive Summary
- Requirements Status Summary
- Host Status Summary
- Detailed Findings

Executive Summary

The Executive Summary briefly describes the contents of the report.

Requirements Status Summary

The Requirements Status Summary presents a pass or fail status for the following PCI-DSS requirements:

- 2.2.1 The organization implements only one primary function per server to prevent functions that require different security levels from co-existing on the same server.
- 2.3 The organization encrypts all non-console administrative access such as browser or web-based management tools.
- 6.1 The organization ensures that all system components and software have the latest vendor supplied security patches installed. Deploy critical patches within a month of release.
- 8.2 The organization employs at least one of these to authenticate all users: password or passphrase or two-factor authentication.
- 8.4 The organization renders all passwords unreadable for all system components both in storage and during transmission using strong cryptography based on approved standards.
- 8.5 The organization ensures proper user authentication and password management for nonconsumer users and administrators on all system components.
- 8.5.8 The organization does not use group, shared, or generic accounts and passwords, or other authentication methods.
- 8.5.10 The organization requires a minimum password length of at least seven characters.
- 8.5.11 The organization uses passwords containing both numeric and alphabetic characters.

Host Status Summary

The Host Status Summary presents the pass or fail results for each host in the project. A host will have a pass status if it passes every PCI-DSS requirement that Metasploit Pro reports on; otherwise, it will have a fail status.

Detailed Findings

The Detailed Findings section provides the technical details for each FISMA requirement. For each FISMA requirement, the report lists each host that did not meet the criteria set by each standard.

PCI Requirement 2.2.1

This requirement mandates that hosts should only have one primary function. Each function should be implemented on separate servers. This section lists the hosts that have more than one listening service

defined as a major system component.

For each host that failed this requirement, this section reports the following information:

- The host IP address and name
- The operating system running on the host
- The services and ports that were discovered on the host

PCI Requirement 2.3

This requirement mandates that all non-console administrative access, such as Telnet and rlogin, be encrypted using strong cryptography, such as SSH or SSL. This section lists the hosts that do not enforce strong encryption methods or have HTTP listening on Cisco devices.

For each host that failed this requirement, this section reports the following information:

- The host IP address and name
- The operating system running on the host
- The services and ports that were discovered on the host

PCI Requirement 6.1

This requirement mandates that all known vulnerabilities must have the latest vendor security patches applied. This section displays all hosts that have exploitable vulnerabilities.

For each host that failed this requirement, this section reports the following information:

- The host IP address and name
- · The operating system running on the host
- The services and ports that were discovered on the host

PCI Requirement 8.2

This section displays hosts that do not use password authentication or two-factor authentication. By failing this requirement, the target indicates that it does not enforce passwords/passphrases or authentication via token device.

For each credential that failed this requirement, this section reports the following information:

- The host IP address and name
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for the credential

PCI Requirement 8.4

This requirement mandates that passwords should be encrypted during storage. This section displays hosts that have private data stored for validated logins.

For each credential that failed this requirement, this section reports the following information:

- The host IP address and name
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for the credential

PCI Requirement 8.5.8

This requirement mandates that generic usernames are not used. This section displays the credentials that have the any of the following usernames: user, root, administrator, admin, tomcat, cisco, manager, sa, postgres, or guest.

For each credential that failed this requirement, this section reports the following information:

- The host IP address and name on which the credential was validated
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for the credential

PCI Requirement 8.5.10

This requirement mandates that all passwords have a minimum character length of at least seven characters. This section displays validated passwords that contain less than seven characters .

For each credential that failed this requirement, this section reports the following information:

- . The host IP address and name on which the credential was validated
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for the credential

PCI Requirement 8.5.11

This requirement mandates that passwords contain both numeric and alphabetic characters. This section displays validated passwords that do not contain both alphabetic and numeric characters.

For each credential that failed this requirement, this section reports the following information:

- The host IP address and name on which the credential was validated
- The operating system running on the host
- The public value, private type, private value, origin type, and origin detail for the credential

PCI Compliance Report Options

Credentials Domino MetaModule Report

The Credentials Domino MetaModule performs an iterative credentials-based attack to identify the attack routes that are possible when a session is obtained on or a credential is captured from a particular host. It helps you identify the targets that can be successfully compromised and the additional credentials that can be captured by leveraging a particular credential or session, and it presents the results of the attack in the Credentials Domino MetaModule Report. You can generate the report to provide a record of the results of the attack in a tangible output, such as a PDF file.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Cover Page
- Executive Summary
- Project Summary
- Run Summary
- Findings Summary
- Summary Charts
- Compromised High Value Hosts
- Uncompromised High Value Hosts
- All Compromised Hosts
- All Uncompromised Hosts
- Appendix

Executive Summary

The Executive Summary provides a high-level recap of the findings from the MetaModule run, which includes the number of hosts that were targeted, the number of hosts that were compromised, and the number of high value hosts that were compromised.

Project Summary

The Project Summary lists the project name and the user who generated the report.

Run Summary

The Run Summary lists the runtime data for Credentials Domino MetaModule.

It includes the following data:

- Runtime The total runtime for the Credentials Domino MetaModule.
- Iterations The total number of iterations the Credentials Domino MetaModule performed.
- Initial host The host that has the login or session that the Credentials Domino MetaModule used to start the attack.
- Entry point The login or session that the Credentials Domino MetaModule used to start the attack.

Findings Summary

The Findings Summary provides an overview of the data captured by the Credentials Domino MetaModule.

It includes the following data:

- Hosts selected The number of target hosts selected for the attack.
- High Value Hosts The number of High Value Hosts targeted during the attack.
- Credentials captured The total number of credentials collected from the attack.
- Hosts compromised The total number and percentage of hosts on which a session was opened during the attack.
- High Value Hosts compromised The total number and percentage of High Value Hosts on which a session was opened during the attack.

Summary Charts

The Summary Charts section presents a graphical breakdown of the compromise rates based on hosts and services and the activity for each iteration.

This section displays the following graphs:

• Host Compromise Rates - Shows the relative distribution of hosts that were compromised. This graph displays findings for High Value Hosts and normal hosts.

• Activity by Iteration - Shows the number of logins and credentials that were captured during each iteration of the attack.

Compromised High Value Hosts

High Value Hosts identify critical hosts in an organization, such as domain controllers and servers that contain sensitive financial information. If you designated High Value Hosts when you configured the Credentials Domino MetaModule, these hosts will be included in the Compromised High Value Hosts section and will be highlighted in the report with a bold red tag. This Compromised High Value Hosts section presents the granular details for each High Value Host on which the MetaModule was able to successfully open a session and capture credentials.

The following information is included for each host:

- The host name
- The host IP address
- The host operating system
- The service that the MetaModule targeted
- The date and time the MetaModule was able to access the target
- The total number of captured credentials
- The compromise chain, which chronologically lists the series of hosts that were compromised in order to access the current host.

Uncompromised High Value Hosts

This Uncompromised High Value Hosts section presents the granular details for each High Value Host on which the MetaModule was unable to open a session.

The following information is included for each host:

- The host name
- The host IP address
- The host operating system
- The date and time the MetaModule attempted to access the target

All Compromised Hosts

The All Compromised Hosts section lists all hosts on which the MetaModule was able to successfully open a session and capture credentials.

The following information is included for each host:

- The host name
- The host IP address
- The host operating system
- The service that the MetaModule targeted
- The total number of captured credentials
- High Value Host designation

All Uncompromised Hosts

The All Uncompromised Hosts section lists all hosts on which the MetaModule was unable to open a session, and therefore, was unable to collect credentials.

The following information is included for each host:

- The host name
- The host IP address
- The host operating system

- The service that the MetaModule targeted
- The date and time the MetaModule attempted to access the target
- High Value Host designation

Appendix

The Appendix provides additional details about the Credentials Domino MetaModule Report, such as the options that were used to generate the report.

Credentials Report Options

Output formats	PDF, HTML, WORD, RTF						
Report options	Include charts and graphs - Includes visual aids, such as pie graphs, to accompany statistical findings in the report.						
Report sections	The Credentials Domino MetaModule Report includes the following sections: Cover Page, Executive Summary, Project Summary, Run Summary, Findings Summary, Summary Charts, Compromised High Value Hosts, Uncompromised High Value Hosts, All Compromised Hosts, All Uncompromised Hosts, and Appendix.						
MetaModule Options	Lists the options that were configured for the MetaModule run, including the Maximum iterations, Overall timeout, Timeout per service, Included hosts, Excluded hosts, and High Value Hosts.						

Known Credentials Intrusion Report

The Known Credentials Intrusion Report presents the results from using all the credentials in a project against targeted hosts and services.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Project Summary
- Findings Summary
- · Authenticated Services and Hosts Summary Charts
- Authenticated Services and Hosts Summary Details
- Appendix

Project Summary

The Project Summary shows the project name and the user who generated the report.

Findings Summary

The Findings Summary lists the following information:

- MetaModule The MetaModule that was run.
- Runtime The total duration of the MetaModule run.
- Hosts selected The total number of hosts that were selected as targets for the MetaModule.
- Hosts tried The total number of hosts that the MetaModule attempted to authenticate to.
- Sessions opened The total number of sessions that the MetaModule opened on all targets.

Authenticated Services and Hosts Summary Charts

The Authenticated Services and Hosts Summary Charts section uses pie charts to visualize the relative distribution of the top five hosts on which the MetaModule was able to open sessions.

The following image shows the Authentication Services and Hosts Summary Charts:

Authenticated Services and Hosts Details

The Authenticated Services and Hosts Details section lists the technical details for each target on which the MetaModule was able to open a session. The report organizes targets by host name and lists the session information under each host.

Each host will have the following information:

- The timestamp for when the host was added to the project
- The type of session that was established between Metasploit and the target.
- The timestamp for when the session was opened.
- The timestamp for when the session was closed.

Appendix

The Appendix provides additional details about the Known Credentials Intrusion Report, such as the options that were used to generate the report.

Report Options

Selected services Lists the services that were selected for the MetaModule to at authenticate to.	

Single Password Testing MetaModule Report

The Single Password Testing MetaModule Report presents the results from using a particular username and plaintext password against targeted hosts and services. At a high-level, the report displays graphs to show the relative distribution of the top five hosts and services that were authenticated using the credential pair. The report also includes the technical details for each target that was successfully authenticated to using the username and password.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Project Summary
- Findings Summary
- Authenticated Services and Hosts Summary Charts
- Authenticated Services and Hosts Summary Details
- Appendix

Project Summary

The Project Summary shows the project name and the user who generated the report.

Findings Summary

The Findings Summary lists the following information:

- MetaModule The MetaModule that was run.
- Runtime The total duration of the MetaModule run.
- Username selected The username that the MetaModule used to attempt to authenticate to a target.
- Password selected The password that the MetaModule used to attempt to authenticate to a target.
- Hosts selected The total number of hosts that were selected as targets for the MetaModule.
- Services selected The total number of services that were targeted.
- Credentials selected The total number of credentials that were provided for the MetaModule run.
- Successful logins The total number of logins that the MetaModule was able to establish.

Authenticated Services and Hosts Summary Charts

The Authenticated Services and Hosts Summary Charts section uses pie charts to visualize the relative distribution of the top five hosts that the MetaModule was able to authenticate to and the top five services that the MetaModule was able to find logins for using the provided username and password.

The following image shows the Authentication Services and Hosts Summary Charts:

Authenticated Services and Hosts Details

The Authenticated Services and Hosts Details section lists the technical details for each target on which the MetaModule was able to authenticate with the provided username and password. Targets are listed by host name. For each host, the report lists the services that the MetaModule was able to successfully authenticate to and the details for each service.

Each service will have the following information:

- The port number
- The protocol
- The service name
- The timestamp for the login attempt
- The result of the login
- The access level for the login

Appendix

The Appendix provides additional details about the Single Password Testing Report, such as the options that were used to generate the report.

SSH Key Testing MetaModule Report

The SSH Key Testing MetaModule Report presents the results from using a particular username and SSH key against targeted hosts and services. At a high-level, the report displays graphs to show the relative distribution of the top five hosts and services that were authenticated using the username and SSH key. The report also includes the technical details for each target that was successfully authenticated to using the SSH key and username.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Project Summary
- Findings Summary
- Authenticated Services and Hosts Summary Charts
- · Authenticated Services and Hosts Summary Details
- Appendix

Project Summary

The Project Summary shows the project name and the user who generated the report.

Findings Summary

The Findings Summary lists the following information:

- MetaModule The MetaModule that was run.
- Runtime The total duration of the MetaModule run.
- Username selected The username that the MetaModule used to attempt to authenticate to a target.
- SSH key selected The SSH key that the MetaModule used to attempt to authenticate to a target.
- Hosts selected The total number of hosts that were selected as targets for the MetaModule.
- Services selected The total number of services that were targeted.
- Hosts tried The total number of hosts that the MetaModule attempted to authenticate to.
- Services tried The total number of services that the MetaModule attempted to authenticate to.
- Successful logins The total number of logins that the MetaModule was able to establish.

Authenticated Services and Hosts Summary Charts

The Authenticated Services and Hosts Summary Charts section uses pie charts to visualize the relative distribution of the top five hosts that the MetaModule was able to authenticate to and the top five services that the MetaModule was able to find logins for using the provided username and SSH key.

The following image shows the Authentication Services and Hosts Summary Charts:

Authenticated Services and Hosts Details

The Authenticated Services and Hosts Details section lists the technical details for each target on which the MetaModule was able to authenticate with the provided SSH key and username. Targets are listed by host name. For each host, the report lists the services that the MetaModule was able to successfully authenticate to and the details for each service.

Each service will have the following information:

- The port number
- The protocol
- The service name
- · The timestamp for the login attempt
- The result of the login
- The access level for the login

Appendix

The Appendix provides additional details about the SSH Key MetaModule Testing Report, such as the options that were used to generate the report.

Report Options

Output formats	PDF, HTML, WORD, RTF					
Report options	Mask discovered credentials - Masks all credentials from the report. It replaces the private with *MASKED*. Include charts and graphs - Includes visual aids, such as pie graphs, to accompany statistical findings in the report.					
Report sections	 Cover Page Project Summary Findings Summary Authenticated Services and Hosts Summary Charts Authenticated Services and Hosts Summary Details Appendix 					
Selected services	Lists the services that were selected for the MetaModule to attempt to authenticate to.					

Pass the Hash Report

The Pass the Hash Report presents the results from using a particular username and hash against targeted hosts and services. At a high-level, the report displays graphs to show the relative distribution of the top five hosts and services that were authenticated using the credential pair. The report also includes the technical details for each target that was successfully authenticated to using the username and hash.

To help you navigate through the data to find key information, the report is organized into the following sections:

- Project Summary
- Findings Summary
- · Authenticated Services and Hosts Summary Charts
- · Authenticated Services and Hosts Summary Details
- Appendix

Project Summary

The Project Summary shows the project name and the user who generated the report.

Findings Summary

The Findings Summary lists the following information:

- MetaModule The MetaModule that was run.
- Runtime The total duration of the MetaModule run.
- Username selected The username that the MetaModule used to attempt to authenticate to a target.
- NTLM hash selected The hash that the MetaModule used to attempt to authenticate to a target.
- Hosts selected The total number of hosts that were selected as targets for the MetaModule.
- Services selected The total number of services that were targeted.
- Hosts tried The total number of hosts that the MetaModule attempted to authenticate to.
- Services tried The total number of services that the MetaModule attempted to authenticate to.
- Successful logins The total number of logins that the MetaModule was able to establish.

Authenticated Services and Hosts Summary Charts

The Authenticated Services and Hosts Summary Charts section uses pie charts to visualize the relative distribution of the top five hosts that the MetaModule was able to authenticate to and the top five services that the MetaModule was able to find logins for using the provided username and hash.

The following image shows the Authentication Services and Hosts Summary Charts:

Authenticated Services and Hosts Details

The Authenticated Services and Hosts Details section lists the technical details for each target on which the MetaModule was able to authenticate with the provided username and hash. Targets are listed by host name. For each host, the report lists the services that the MetaModule was able to successfully authenticate to and the details for each service.

Each service will have the following information:

- The port number
- The protocol
- The service name
- The timestamp for the login attempt
- The result of the login
- The access level for the login

Metasploit Updates

Software updates contain new features and fixes that are necessary to continuously improve Metasploit. It is strongly recommended that you to install updates as soon as they are available.

Applying the Weekly Update

If you are an administrator, you should regularly check for available updates to Metasploit Pro. If you are using the web interface, notification center alerts you when a newer version is available to install.

To apply the weekly update:

- 1. Click Administration > Software Updates from the main menu.
- 2. When the Software Updates window appears, select **Use an HTTP Proxy** to reach the Internet if you want to use an HTTP proxy server to check for updates. If you select this option, the proxy settings appear. Configure the settings for the HTTP proxy that you want to use.
- 3. Click the **Check for updates** button.

4. If an update is available, the system shows you the latest version number and provides an install button for you to use to update the system.

Updates Available
<u>Version 2013013001</u>
This updates Metasploit to 4.5.2.
This update includes 13 new modules, including exploits for Novell eDirectory, Moveable Type, Rails, SonicWALL GMS, ZoneMinder and Windows. It also includes new modules for Linksys WRT54GL, Titan FTP, Joomla, Ray Sharp DVR and Microsoft Remote Desktop as well as updates to the UPnP scanning module.
In addition, this update fixes five issues.
For more information on this update, see the online release notes.
😴 Install
Received an Offline Update File?

5. Install the update.

After the update completes, Metasploit Pro prompts you to restart the back end services. If you restart the services, Metasploit Pro terminates active sessions and requires up to ten minutes to restart.

Updating Metasploit Offline

Rapid7 provides offline update files that you can use to safely update Metasploit without an Internet connection. For each major release, Rapid7 e-mails you the links and instructions that you need to update Metasploit. The links point you to bin files that you can download and save to a portable storage device or shared network location so that you can easily transfer the file to your Metasploit server.

In order to update Metasploit to the latest version, you must install each incremental release between your current version and the latest version. For example, if your current version of Metasploit is 4.5.2, you need to apply the 4.5.3 update before you can apply the 4.6 update. If you do not apply the updates sequentially, product dependencies may not be upgraded correctly and can cause issues with Metasploit.

To apply an offline update:

- 1. Launch and log in to Metasploit.
- 2. Locate the footer at the bottom of the user interface.

Install Update	

Metasploit installs the update and restarts the Metasploit service when the update is done. Please wait a few minutes for the service to restart.

If there are additional updates that you need to install, you must repeat this process until you have the latest version of Metasploit.

Deleting the Browser Cache after an Update

After you update Metasploit, you must delete your browser's cache so that the user interface renders correctly. If you do not delete your browser's cache, some items may not display or appear distorted.

To learn how to delete your browser's cache, read the documentation for your specific browser or visit this handy web page.

Notification Center

Notification Center is the notification system for Metasploit Pro that alerts you when a task completes or when a software update is available. It displays as a dropdown banner from the Global Menu and provides a unified view of system-wide alerts for all projects.

The Notification Center icon displays the total number of new alerts that are available. All new notifications are highlighted with a green bar. You can click on a notification to access the associated page in the user interface. Most task and MetaModule notifications will take you to the Task log. All system notifications will take you to the Software Updates page.

Accessing Notification Center

To access Notification Center, click on the notification icon in the upper-right hand corner of the Global Menu.

Notification Events

Notification Center displays alerts when the following events occur:

- A MetaModule run completes.
- A task run, such as a Discovery Scan or Bruteforce Attack, completes.
- A software update is available.

Sorting Notifications by Event Type

1. From the Global Menu, click the Notification Center icon.

2. Click the **Show** dropdown button and choose the event type you want to use to sort the notifications. You can choose from MetaModules, Tasks, and System.

Latest Notifications Sho	w All 🗨
Update Notification System Update Available about 23 h	All MetaModules 🔓
Update Notification System Update Available 1 day ago	System
Update Notification System Update Available 1 day ago

3. After you choose an event type, Notification Center updates the alerts.

Clearing a Notification

1. From the Global Menu, click on the Notification Center icon.

- 2. Find the alert that you want to remove.
- 3. Hover your mouse over the alert. A delete button appears.

4. Click the 'X' button to remove the alert.

Managing License Keys

A license key determines the commercial edition that you can access, the number of days that remain on the license, and the number of users that are allowed to use Metasploit at a given time.

Metasploit licenses are perpetual licenses, which enable you to use the application indefinitely. However, the license itself expires every year. When the license expires, you must renew the license if you want to continue to receive updates for Metasploit. You can still run Metasploit, but you can only run the last version that was released before your license key expired.

Activating Metasploit

After you install Metasploit, you must input your license key to activate the product.

If you haven't already activated your copy of Metasploit, go to https://localhost:3790/setup/activation to enter your license key.

If you don't have a license key and need to request one, please visit this page to request one.

Viewing the Current License Key

To access the license key area, select **Administration > Software License** from the Global Menu. The License Key Details shows you the information for the key currently in use.

Metasploit [®]	Project V	Account - tdoan 🔻	Administration V	? 0

Metasploit Logs

Metasploit stores system events in log files. You can use the information in the log files to troubleshoot issues you've encountered with Metasploit. For example, if you need to troubleshoot an issue with updates, you can view the license log to see a list of events related to product activation, license keys, and updates.

Log files can become large over time, so you may need to manually clear the log files to reduce the amount of disk space that they consume.

The follow logs are available for you to use to troubleshoot issues:

- <u>Framework log</u>: This log contains information about loading the Metasploit Framework. You can view this log to troubleshoot issues that you may have with running modules. The Framework log is located in /metasploit/apps/pro/engine/config/logs/framework.
- <u>License log</u>: This log contains the events related to product licensing and product updates. You can view this log to troubleshoot problems that you may have applying a license key or installing an update. The license log is located in /metasploit/apps/pro/engine.
- <u>PostgreSQL log</u>: This log documents the start up and shutdown notices. You can view this log to track the latest events in the database. The PostgreSQL log is located in /metasploit/postgresql.
- <u>Production log</u>: This log contains all Rails events. You can use this log to troubleshoot Rails issues, such as routing errors, and to trace the actions that were taken for a particular connection. The production log is located in /metaploit/apps/pro/ui/log.
- <u>Pro service log</u>: This log contains the events for Pro service. You can view this log to troubleshoot errors with the Metasploit service. The Pro service log is located in /metasploit/apps/pro/engine.
- <u>Thin log</u>: This log contains the events for Thin service. You can view this log to diagnose issues between Rails and Nginx. The Thin log is located in /metasploit/apps/pro/ui/log.
- Web server error log: This log contains all Nginx errors and warnings. You can view this log to identify if an issue is related to Nginx rather than Rails or Pro Service. The error log is located in /metasploit/apps/pro/nginx/log.
- Web server access log: This log contains every GET and POST request to Nginx and logs successful HTTP requests. Use this log to track down Rails issues. The access log is located in /metasploit/apps/pro/nginx/log.

Backing Up and Restoring Metasploit Data

Hardware failures and data loss can happen to anyone. That's why it's critical for you to regularly back up your Metasploit data. Because let's face it, your projects contain very important and sensitive data, and losing that data could have a massively negative impact.

To protect yourself from data loss, you should routinely back up Metasploit so that you can:

- Repair your copy of Metasploit Backing up your data can help you repair Metasploit so that you don't lose your configuration settings or any project data.
- Migrate data between different Metasploit servers Being able to transfer data between multiple instances of Metasploit can be helpful if you experience any hardware changes or failures.

Backing Up Data

A backup contains everything you need to restore Metasploit to a specific state, such as your application settings and your projects. The only thing that does not migrate is the software version. Your Metasploit instance will stay on its current version.

When you back up Metasploit, everything in the database is compressed into a ZIP file and stored in /path/to/metasploit/apps/pro/backups. The files are not overwritten when you restore Metasploit to a specific backup, so they will be available until you manually delete them or you uninstall Metasploit.

To back up your Metasploit data:

- 1. Go to Administration > Global Settings.
- 2. Select the Backups tab.

The Create a Backup page appears.

4. Enter a name and a description for the backup file on the Create a Backup page.

metasploit [®]	Project ▼
Home Global Settings	Backups Create
Create a Backup	
Name	
Name January-2016	
Name January-2016 Description	
Name January-2016 Description All my pentests from Jai	nuary 2016

You should provide a clear and concise description so that you can easily identify the contents of each file. This will be helpful when you go to restore a backup and you have multiple files to choose from.

5. Click the Create Backup button.

When the Backups page appears, you'll see that the backup file has been created. The Status column displays the progress for the backup. When the backup completes, you'll see an alert in Notification Center. You'll need to refresh the page to see the updated status.

Restoring a Backup

A restore reverts your Metasploit server back to the state captured in a backup file. The backup files are platform independent so you can restore data from one operating system to another without any issues.

When you restore a backup file, everything in that is currently in your Metasploit instance will be overwritten with the data in the backup file, including your user accounts, loot, reports, and logs. Any data that does not exist in the backup file will be lost.
In order to restore a backup, all the Metasploit processes must be stopped so that the database can be modified. After the database has been restored, the Metasploit services will be restarted and you'll be able to use Metasploit as usual. Don't worry. You don't have to manually shut down your processes. We'll do it for you.

Before you restore a backup, you should check if there are any tasks currently running on the server. During a restore, these tasks will be stopped, so any data that has been collected will be lost. You should alert other users that you plan to restore the system to a previous version of Metasploit, so they can backup the data that they need.

To restore a backup:

- 1. Go to Administration > Global Settings.
- 2. Select the Backups tab.

	030116-backup		2016-03-11 12:25:14 -0800	4.11.6-dev	0.0 MB	0.0 MB	Preparing	(1) Restore		

 A confirmation window appears and notifies you that you will overwrite everything in your database. Click the **Restore** button when you are ready.

At this point, all Metasploit services will be stopped, and you'll be directed to a progress page. When the restore is complete, the Metasploit services will be restarted and you'll see a link back to Metasploit.

Restoring to Older Versions of Metasploit

We only support forward compatibility, which means you can restore a backup to the same version or a newer version of Metasploit. For example, if your backup file was created on Metasploit 4.11.6, you cannot restore that file on an older version, like Metasploit 4.11.5. However, you can restore it to a newer version, like Metasploit 4.11.7.

To check the version of your backup, go to the Backups area and look in the Metasploit Version column.

Logging in after a Backup

When you restore a backup file, everything in your Metasploit instance will be overwritten, including your user accounts. If you have restored the backup file to a different instance of Metasploit, you may not be able to use your old credentials to log in. If you have restored a backup file and can no longer log in to Metasploit, you can run the reset password script obtain new credentials.

Finding the Backup Files

The backup files are located in /path/to/metasploit/apps/pro/backups.

If you plan to uninstall Metasploit, you should copy the files in this directory to different location on your machine. Or if you want to share the backup files with another instance of Metasploit, you can copy them from this location.

Resetting the Password for a User Account

If you forget your password or need reset your password, follow the instructions for your operating system.

Resetting an Account Password on Windows

- 1. From the Start menu, choose All Programs > Metasploit > Password Reset.
- 2. When the Password Reset window appears, wait for the environment to load.

- 3. When the dialog prompts you to continue, enter yes. The system resets the password to a random value.
- 4. Copy the password and use the password the next time you log in to Metasploit Pro.

You can change the password after you log in to Metasploit Pro.

5. Exit the Password Reset window.

Resetting an Account Password on Linux

1. Open the command line terminal and cd into the Metasploit directory:

\$ cd /opt/metasploit/

2. Enter the following command to launch the diagnostic script:

\$ sudo ./diagnostic_shell.sh

If prompted, enter your sudo password.

3. When the system returns the bash prompt, enter the following:

bash-4.2# /opt/metasploit/apps/pro/ui/script/resetpw

- 4. The prompt asks you if you want to continue. Type 'yes' to reset the password.
- 5. A random password is generated and displayed in the prompt. Copy the password and use the password the next time you log into Metasploit Pro. You can change the password after you log in to Metasploit Pro.
