

Create-php-container

Just a simple tool that creates a php setup in a docker LAMP stack.

Prerequisites

This tool has some commands that depend on Docker, so you will need to install that

You can run the same setup without docker if you have a local *AMP server already up and running.

How to use it

You will need to use this format:

```
create-php-container <type> <name>
```

For example: `create-php-container container-only test123`

command	description
<code>create-php-container container-only <project></code>	starts LAMP stack docker container
<code>create-php-container container-vanilla <project></code>	starts LAMP stack docker container + vanilla php
<code>create-php-container container-mvc <project></code>	starts LAMP stack docker container + mvc php
<code>create-php-container rogue-vanilla <project></code>	starts vanilla php project in current folder
<code>create-php-container rogue-mvc <project></code>	starts mvc php project in current folder
<code>create-php-container down current</code>	stop current project
<code>create-php-container cleanup all</code>	stop and remove ALL docker projects
